OASIS 🕅

Common Alerting Protocol, v. 1.1

Committee Draft, 28 April 2005

Document Identifier: CAP-V1.1

Location:

http://docs.oasis-open.org/emergency/CAP/V1.1/

Technical Committee:

OASIS Emergency Management TC

Editor(s):

Elysa Jones, Warning Systems, Inc <ejones@warningsystems.com> Art Botterell, Individual <acb@incident.com>

Abstract:

The Common Alerting Protocol (CAP) is a simple but general format for exchanging all-hazard emergency alerts and public warnings over all kinds of networks. CAP allows a consistent warning message to be disseminated simultaneously over many different warning systems, thus increasing warning effectiveness while simplifying the warning task. CAP also facilitates the detection of emerging patterns in local warnings of various kinds, such as might indicate an undetected hazard or hostile act. And CAP provides a template for effective warning messages based on best practices identified in academic research and real-world experience.

Status:

This document is a Committee Specification of the Emergency Management Technical Committee. This document is updated periodically. Send comments about this document to the editor.

Committee members should send comments on this specification to the emergency@lists.oasisopen.org list. Others should subscribe to and send comments to the emergencycomment@lists.oasis-open.org list. To subscribe, send an email message to emergencycomment-request@lists.oasis-open.org with the word "subscribe" as the body of the message. For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Emergency Management TC web page (http://www.oasis-open.org/committees/emergency/).

Notices

OASIS takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on OASIS's procedures with respect to rights in OASIS specifications can be found at the OASIS website. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementors or users of this specification, can be obtained from the OASIS President.

OASIS invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary rights which may cover technology that may be required to implement this specification. Please address the information to the OASIS President.

1 Introduction 1

1.1 Purpose 2

3 The Common Alerting Protocol (CAP) provides an open, non-proprietary digital message format for all 4 types of alerts and notifications. It does not address any particular application or telecommunications 5 method. The CAP format is compatible with emerging techniques, such as Web services, as well as existing formats including the Specific Area Message Encoding (SAME) used for the United States' 6 7 National Oceanic and Atmospheric Administration (NOAA) Weather Radio and the Emergency Alert 8 System (EAS), while offering enhanced capabilities that include:

- 9 Flexible geographic targeting using latitude/longitude shapes and other geospatial 10 representations in three dimensions;
- 11 Multilingual and multi-audience messaging; •
- 12 Phased and delayed effective times and expirations; •
- 13 Enhanced message update and cancellation features; •
- 14 Template support for framing complete and effective warning messages; •
- 15 Compatible with digital encryption and signature capability; and, •
- 16 Facility for digital images and audio. •
- 17 Key benefits of CAP will include reduction of costs and operational complexity by eliminating the need for
- multiple custom software interfaces to the many warning sources and dissemination systems involved in 18
- all-hazard warning. The CAP message format can be converted to and from the "native" formats of all 19
- kinds of sensor and alerting technologies, forming a basis for a technology-independent national and 20
- international "warning internet." 21

1.2 History 22

- 23 The National Science and Technology Council report on "Effective Disaster Warnings" released in
- 24 November, 2000 recommended that "a standard method should be developed to collect and relay
- 25 instantaneously and automatically all types of hazard warnings and reports locally, regionally and
- 26 nationally for input into a wide variety of dissemination systems."
- 27 An international working group of more than 130 emergency managers and information technology and 28
- telecommunications experts convened in 2001 and adopted the specific recommendations of the NSTC
- 29 report as a point of departure for the design of a Common Alerting Protocol (CAP). Their draft went 30 through several revisions and was tested in demonstrations and field trials in Virginia (supported by the
- 31 ComCARE Alliance) and in California (in cooperation with the California Office of Emergency Services)
- 32 during 2002 and 2003.
- 33 In 2002 the CAP initiative was endorsed by the national non-profit Partnership for Public Warning, which
- sponsored its contribution in 2003 to the OASIS standards process. In 2004, CAP version 1.0 was 34
- adopted as an OASIS Standard. 35

1.3 Structure of the CAP Alert Message 36

- 37 Each CAP Alert Message consists of an <alert> segment, which may contain one or more <info>
- segments, each of which may include one or more <area> segments. Under most circumstances CAP 38
- 39 messages with a <msgType> value of "Alert" SHOULD include at least one <info> element. (See the
- 40 document object model diagram in section 3.1, below.)

41 **1.3.1 <alert>**

42 The <alert> segment provides basic information about the current message: its purpose, its source and

- 43 its status, as well as unique identifier for the current message and links to any other, related messages.
- 44 An <alert> segment may be used alone for message acknowledgements, cancellations or other system
- 45 functions, but most <alert> segments will include at least one <info> segment.

46 1.3.2 <info>

47 The <info> segment describes an anticipated or actual event in terms of its urgency (time available to

- 48 prepare), severity (intensity of impact) and certainty (confidence in the observation or prediction), as well
- 49 as providing both categorical and textual descriptions of the subject event. It may also provide
- 50 instructions for appropriate response by message recipients and various other details (hazard duration,
- technical parameters, contact information, links to additional information sources, etc.) Multiple <info>
- 52 segments may be used to describe differing parameters (e.g., for different probability or intensity "bands")
- 53 or to provide the information in multiple languages.

54 1.3.3 <resource>

55 The <resource> segment provides an optional reference to additional information related to the <info> 56 segment within which it appears in the form of a digital asset such as an image or audio file.

57 1.3.4 <area>

58 The <area> segment describes a geographic area to which the <info> segment in which it appears

- applies. Textual and coded descriptions (such as postal codes) are supported, but the preferred
- 60 representations use geospatial shapes (polygons and circles) and an altitude or altitude range, expressed
- 61 in standard latitude / longitude / altitude terms in accordance with a specified geospatial datum.

62 **1.4 Applications of the CAP Alert Message**

63 The primary use of the CAP Alert Message is to provide a single input to activate all kinds of alerting and

- 64 public warning systems. This reduces the workload associated with using multiple warning systems while 65 enhancing technical reliability and target-audience effectiveness. It also helps ensure consistency in the
- 66 information transmitted over multiple delivery systems, another key to warning effectiveness.
- A secondary application of CAP is to normalize warnings from various sources so they can be aggregated and compared in tabular or graphic form as an aid to situational awareness and pattern detection.
- 69 Although primarily designed as an interoperability standard for use among warning systems and other
- 70 emergency information systems, the CAP Alert Message can be delivered directly to alert recipients over
- 71 various networks, including data broadcasts. Location-aware receiving devices could use the information
- in a CAP Alert Message to determine, based on their current location, whether that particular message
- 73 was relevant to their users.
- The CAP Alert Message can also be used by sensor systems as a format for reporting significant events
 to collection and analysis systems and centers.

76 **1.5 Terminology**

77 The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD

- NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in **[RFC2119]**.
- 80 The words *warning*, *alert* and *notification* are used interchangeably throughout this document.
- 81 The term "coordinate pair" is used in this document to refer to a comma-delimited pair of decimal values
- describing a geospatial location in degrees, unprojected, in the form "[latitude],[longitude]". Latitudes in
- the Southern Hemisphere and longitudes in the Western Hemisphere are signed negative with a leading

112 **2 Design Principles and Concepts (non-normative)**

113 2.1 Design Philosophy

- 114 Among the principles which guided the design of the CAP Alert Message were:
- Interoperability First and foremost, the CAP Alert Message should provide a means for interoperable exchange of alerts and notifications among all kinds of emergency information systems.
- Completeness The CAP Alert Message format should provide for all the elements of an effective public warning message.
- Simple implementation The design should not place undue burdens of complexity on technical implementers.
- Simple XML and portable structure Although the primary anticipated use of the CAP Alert
 Message is as an XML document, the format should remain sufficiently abstract to be adaptable
 to other coding schemes.
- Multi-use format One message schema supports multiple message types (e.g., alert / update / cancellations / acknowledgements / error messages) in various applications (actual / exercise / test / system message.)
- Familiarity The data elements and code values should be meaningful to warning originators and non-expert recipients alike.
- Interdisciplinary and international utility The design should allow a broad range of
 applications in public safety and emergency management and allied applications and should be
 applicable worldwide.

133 2.2 Requirements for Design

- 134 Note: The following requirements were used as a basis for design and review of the CAP 135 Alert Message format. This list is non-normative and not intended to be exhaustive.
- 136 The Common Alerting Protocol SHOULD:
- Provide a specification for a simple, extensible format for digital representation of warning messages and notifications;
- Enable integration of diverse sensor and dissemination systems;
- Be usable over multiple transmission systems, including both TCP/IP-based networks and oneway "broadcast" channels;
- Support credible end-to-end authentication and validation of all messages;
- Provide a unique identifier (e.g., an ID number) for each warning message and for each message originator;
- Provide for multiple message types, such as:
- 146 Warnings
 147 Acknowledgements
- 148 Expirations and cancellations
- 149 Updates and amendments
- 150 Reports of results from dissemination systems
- 151 Administrative and system messages
- Provide for multiple message types, such as:

153	 Geographic targeting
154	 Level of urgency
155	 Level of certainty
156	 Level of threat severity
157 158	 Provide a mechanism for referencing supplemental information (e.g., digital audio or image files, additional text);
159	 Use an established open-standard data representation;
160	 Be based on a program of real-world cross-platform testing and evaluation;
161	• Provide a clear basis for certification and further protocol evaluation and improvement; and,
162 163	 Provide a clear logical structure that is relevant and clearly applicable to the needs of emergency response and public safety users and warning system operators.
164	2.3 Examples of Use Scenarios

Note: The following examples of use scenarios were used as a basis for design and
 review of the CAP Alert Message format. These scenarios are non-normative and not
 intended to be exhaustive or to reflect actual practices.

168 2.3.1 Manual Origination

"The Incident Commander at an industrial fire with potential of a major explosion decides to issue a public
alert with three components: a) An evacuation of the area within half a mile of the fire; b) a shelter-inplace instruction for people in a polygon roughly describing a downwind dispersion 'plume' extending
several miles downwind and half a mile upwind from the fire; and c) a request for all media and civilian
aircraft to remain above 2500 feet above ground level when within a half mile radius of the fire.

"Using a portable computer and a web page (and a pop-up drawing tool to enter the polygon) the IncidentCommander issues the alert as a CAP message to a local alerting network."

176 2.3.2 Automated Origination by Autonomous Sensor System

"A set of automatic tsunami warning sirens has been installed along a popular Northwest beach. A wireless network of sensor devices collocated with the sirens controls their activation. When triggered, each sensor generates a CAP message containing its location and the sensed data at that location that is needed for the tsunami determination. Each siren activates when the combination of its own readings and those reported at by other devices on the network indicate an immediate tsunami threat. In addition, a network component assembles a summary CAP message describing the event and feeds it to regional and national alerting networks."

184 2.3.3 Aggregation and Correlation on Real-time Map

185 "At the State Operations Center a computerized map of the state depicts, in real time, all current and

186 recent warning activity throughout the state. All major warning systems in the state – the Emergency

187 Alert System, siren systems, telephone alerting and other systems – have been equipped to report the

- details of their activation in the form of a CAP message. (Since many of them are now activated by way
- 189 of CAP messages, this is frequently just a matter of forwarding the activation message to the state 190 center.)
- 191 "Using this visualization tool, state officials can monitor for emerging patterns of local warning activity and
- correlate it with other real time data (e.g., telephone central office traffic loads, 9-1-1 traffic volume,
 seismic data, automatic vehicular crash notifications, etc.)."

194 **2.3.4 Integrated Public Alerting**

"As part of an integrated warning system funded by local industry, all warning systems in a communitycan be activated simultaneously by the issuance by authorized authority of a single CAP message.

- 197 "Each system converts the CAP message data into the form suitable for its technology (text captioning on
- 198 TV, synthesized voice on radio and telephone, activation of the appropriate signal on sirens, etc.).
- 199 Systems that can target their messages to particular geographic areas implement the targeting specified 200 in the CAP message with as little 'spill' as their technology permits.
- "In this way, not only is the reliability and reach of the overall warning system maximized, but citizens also
 get corroboration of the alert through multiple channels, which increases the chance of the warning being
 acted upon."

204 **2.3.5 Repudiating a False Alarm**

205 "Inadvertently the integrated alerting network has been activated with an inaccurate warning message.

206 This activation comes to officials' attention immediately through their own monitoring facilities (e.g., 2.3.3

above). Having determined that the alert is, in fact, inappropriate, the officials issue a cancellation

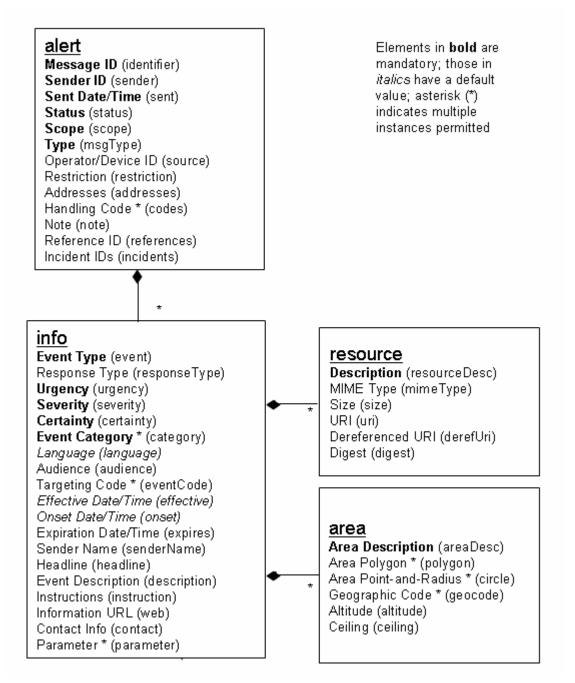

208 message that refers directly to the erroneous prior alert. Alerting systems that are still in the process of

delivering the alert (e.g., telephone dialing systems) stop doing so. Broadcast systems deliver the

210 cancellation message. Other systems (e.g., highway signs) simply reset to their normal state."

211 3 Alert Message Structure (normative)

212 3.1 Document Object Model

213

214

215 3.2 Data Dictionary

216

- Note: Unless explicitly constrained within this Data Dictionary or the XML Schema (Section 3.4), CAP elements may have null values. Implementers MUST check for this
- (Section 3.4), CAP elements may have null values. Implencondition wherever it might affect application performance.
- 219

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
3.2.1 "alert"	Element and Sub	o-elements	
alert	cap. alert. group	The container for all component parts of the alert message (REQUIRED)	 (1) Surrounds CAP alert message subelements. (2) MUST include the xmlns attribute referencing the CAP URI as the namespace, e.g.: <cap:alert xmlns:cap="http://www.incident.com/c ap/1.1"> [sub-elements]</cap:alert> (3) In addition to the specified subelements, MAY contain one or more <info> blocks.</info>
identifier	cap. alert. identifier	The identifier of the alert message (REQUIRED)	 A number or string uniquely identifying this message, assigned by the sender MUST NOT include spaces, commas or restricted characters (< and &)
sender	cap. alert. sender. identifier	The identifier of the sender of the alert message (REQUIRED)	 Identifies the originator of this alert. Guaranteed by assigner to be unique globally; e.g., may be based on an Internet domain name MUST NOT include spaces, commas or restricted characters (< and &)
source	cap. alert. source. identifier	The text identifying the source of the alert message (OPTIONAL)	The particular source of this alert; e.g., an operator or a specific device.

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
sent	cap. alert. sent. time	The time and date of the origination of the alert message (REQUIRED)	The date and time is represented in [dateTime] format (e. g., "2002-05- 24T16:49:00-07:00" for 24 May 2002 at 16: 49 PDT).
status	cap. alert. status. code	The code denoting the appropriate handling of the alert message (REQUIRED)	Code Values: "Actual" - Actionable by all targeted recipients "Exercise"- Actionable only by designated exercise participants; exercise identifier should appear in <note> "System" - For messages that support alert network internal functions. "Test" - Technical testing only, all recipients disregard</note>
scope	cap. alert. scope. code	The code denoting the intended distribution of the alert message (REQUIRED)	Code Values: "Public" - For general dissemination to unrestricted audiences "Restricted" - For dissemination only to users with a known operational requirement (see <restriction>, below) "Private" - For dissemination only to specified addresses (see <address>, below)</address></restriction>
restriction	cap. alert. restriction. text	The text describing the rule for limiting distribution of the restricted alert message (conditional)	Used when <scope> value is "Restricted"</scope>
addresses	cap. alert. addresses. group	The group listing of intended recipients of the private alert message (conditional)	 Used when <scope> value is "Private"</scope> Each recipient SHALL be identified by an identifier or an address Multiple space-delimited addresses MAY be included. Addresses including whitespace MUST be enclosed in double-quotes.

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
code	cap. alert. code	The code denoting the special handling of the alert message (OPTIONAL)	Any user-defined flag or special code used to flag the alert message for special handling.
msgType	cap. alert. type. code	The code denoting the nature of the alert message (REQUIRED)	Code Values: "Alert" - Initial information requiring attention by targeted recipients "Update" - Updates and supercedes the earlier message(s) identified in <references> "Cancel" - Cancels the earlier message(s) identified in <references> "Ack" - Acknowledges receipt and acceptance of the message(s)) identified in <references> "Error" indicates rejection of the message(s) identified in <references>; explanation SHOULD appear in <note></note></references></references></references></references>
note	cap. alert. note. text	The text describing the purpose or significance of the alert message (OPTIONAL)	The message note is primarily intended for use with Cancel and Error alert message types.
references	cap. alert. references. group	The group listing identifying earlier message(s) referenced by the alert message (OPTIONAL)	 The extended message identifier(s) (in the form <i>sender,identifier,sent</i>) of an earlier CAP message or messages referenced by this one. If multiple messages are referenced, they SHALL be separated by whitespace.

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
incidents	cap. alert. incidents. group	The group listing naming the referent incident(s) of the alert message (OPTIONAL)	 Used to collate multiple messages referring to different aspects of the same incident If multiple incident identifiers are referenced, they SHALL be separated by whitespace. Incident names including whitespace SHALL be surrounded by double-quotes
3.2.2 "info"	Element and Sub	-elements	
info	cap. alertInfo. info. group	The container for all component parts of the info sub-element of the alert message (OPTIONAL)	 Multiple occurrences are permitted within a single <alert>. If targeting of multiple "info" blocks in the same language overlaps, information in later blocks may expand but may not override the corresponding values in earlier ones. Each set of "info" blocks containing the same language identifier SHALL be treated as a separate sequence.</alert> In addition to the specified sub- elements, MAY contain one or more <resource> blocks and/or one or more <area/> blocks.</resource>
language	cap. alertInfo. language. code	The code denoting the language of the info sub- element of the alert message (OPTIONAL)	 Code Values: Natural language identifier per [RFC 3066]. If not present, an implicit default value of "en-US" SHALL be assumed. A null value in this element SHALL be considered equivalent to "en-US."

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
category	cap. alertInfo. category. code	The code denoting the category of the subject event of the alert message (REQUIRED)	 (1) Code Values: "Geo" - Geophysical (inc. landslide) "Met" - Meteorological (inc. flood) "Safety" - General emergency and public safety "Security" - Law enforcement, military, homeland and local/private security "Rescue" - Rescue and recovery "Fire" - Fire suppression and rescue "Health" - Medical and public health "Env" - Pollution and other environmental "Transport" - Public and private transportation "Infra" - Utility, telecommunication, other non-transport infrastructure "CBRNE" – Chemical, Biological, Radiological, Nuclear or High-Yield Explosive threat or attack "Other" - Other events (2) Multiple instances MAY occur within a single <info> block.</info>
event	cap. alertInfo. event. text	The text denoting the type of the subject event of the alert message (REQUIRED)	

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
responseType	cap. alertInfo. responseType. code	The code denoting the type of action recommended for the target audience. (OPTIONAL)	 (1) Code Values: "Shelter" – Take shelter in place or per <instruction></instruction> "Evacuate" – Relocate as instructed in the <instruction></instruction> "Prepare" – Make preparations per the <instruction></instruction> "Execute" – Execute a pre-planned activity identified in <instruction></instruction> "Monitor" – Attend to information sources as described in <instruction></instruction> "Assess" – Evaluate the information in this message. (This value SHOULD NOT be used in public warning applications.) "None" – No action recommended (2) Multiple instances MAY occur within a single <info> block.</info>
urgency	cap. alertInfo. urgency. code	The code denoting the urgency of the subject event of the alert message (REQUIRED)	 (1) The "urgency", "severity", and "certainty" elements collectively distinguish less emphatic from more emphatic messages. (2) Code Values: "Immediate" - Responsive action SHOULD be taken immediately "Expected" - Responsive action SHOULD be taken soon (within next hour) "Future" - Responsive action SHOULD be taken in the near future "Past" - Responsive action is no longer required "Unknown" - Urgency not known

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
severity	cap. alertInfo. severity. code	The code denoting the severity of the subject event of the alert message (REQUIRED)	 (1) The "urgency", "severity", and "certainty" elements collectively distinguish less emphatic from more emphatic messages. (2) Code Values: "Extreme" - Extraordinary threat to life or property "Severe" - Significant threat to life or property "Moderate" - Possible threat to life or property "Minor" - Minimal threat to life or property "Unknown" - Severity unknown
certainty	cap. alertInfo. certainty. code	The code denoting the certainty of the subject event of the alert message (REQUIRED)	 (1) The "urgency", "severity", and "certainty" elements collectively distinguish less emphatic from more emphatic messages. (2) Code Values: "Observed" – Determined to have occurred or to be ongoing. "Likely" - Likely (p > ~50%) "Possible" - Possible but not likely (p <= ~50%) "Unlikely" - Not expected to occur (p ~ 0) "Unknown" - Certainty unknown (3) For backward compatibility with CAP 1.0, the deprecated value of "Very Likely" SHOULD be treated as equivalent to "Likely."
audience	cap. alertInfo. audience. text	The text describing the intended audience of the alert message (OPTIONAL)	

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
eventCode	cap. alertInfo. event. code	A system- specific code identifying the event type of the alert message (OPTIONAL)	 (1) Any system-specific code for event typing, in the form: <eventcode></eventcode> <valuename>valueName</valuename> <value>value>value</value> where the content of "valueName" is a user-assigned string designating the domain of the code, and the content of "value" is a string (which may represent a number) denoting the value itself (e.g., valueName ="SAME" and value="CEM"). (2) Values of "valueName" that are acronyms SHOULD be represented in all capital letters without periods (e.g., SAME, FIPS, ZIP). (3) Multiple instances MAY occur within a single <info> block.</info>
effective	cap. alertInfo. effective. time	The effective time of the information of the alert message (OPTIONAL)	 (1) The date and time is represented in [dateTime] format (e. g., "2002-05- 24T16:49:00-07:00" for 24 May 2002 at 16:49 PDT). (2) If this item is not included, the effective time SHALL be assumed to be the same as in <sent>.</sent>
onset	cap. alertInfo. onset. time	The expected time of the beginning of the subject event of the alert message (OPTIONAL)	The date and time is represented in [dateTime] format (e. g., "2002-05- 24T16:49:00-07:00" for 24 May 2002 at 16: 49 PDT).
expires	cap. alertInfo. expires. time	The expiry time of the information of the alert message (OPTIONAL)	 (1) The date and time is represented in [dateTime] format (e. g., "2002-05-24T16:49:00-07:00" for 24 May 2002 at 16:49 PDT). (2) If this item is not provided, each recipient is free to set its own policy as to when the message is no longer in effect.

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
senderName	cap. alertInfo. sender. name	The text naming the originator of the alert message (OPTIONAL)	The human-readable name of the agency or authority issuing this alert.
headline	cap. alertInfo. headline. text	The text headline of the alert message (OPTIONAL)	A brief human-readable headline. Note that some displays (for example, short messaging service devices) may only present this headline; it SHOULD be made as direct and actionable as possible while remaining short. 160 characters MAY be a useful target limit for headline length.
description	cap. alertInfo. description. text	The text describing the subject event of the alert message (OPTIONAL)	An extended human readable description of the hazard or event that occasioned this message.
instruction	cap. alertInfo. instruction. text	The text describing the recommended action to be taken by recipients of the alert message (OPTIONAL)	An extended human readable instruction to targeted recipients. (If different instructions are intended for different recipients, they should be represented by use of multiple <info> blocks.)</info>
web	cap alertInfo. information. identifier	The identifier of the hyperlink associating additional information with the alert message (OPTIONAL)	A full, absolute URI for an HTML page or other text resource with additional or reference information regarding this alert
contact	cap. alertInfo. contact. text	The text describing the contact for follow-up and confirmation of the alert message (OPTIONAL)	

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
parameter	cap. alertInfo. parameter. group	A system- specific additional parameter associated with the alert message (OPTIONAL)	 (1) Any system-specific datum, in the form: <parameter></parameter> <valuename>valueName</valuename> <value>value</value> where the content of "valueName" is a user-assigned string designating the domain of the code, and the content of "value" is a string (which may represent a number) denoting the value itself (e.g., valueName ="SAME" and value="civ".) (2) Values of "valueName" that are acronyms SHOULD be represented in all capital letters without periods (e.g., SAME, FIPS, ZIP). (3) Multiple instances MAY occur within a single <info> block.</info>

3.2.3 "resource" Element and Sub-elements

resource	cap alertInfoResource. resource. group	The container for all component parts of the resource sub- element of the info sub- element of the alert element (OPTIONAL)	 (1) Refers to an additional file with supplemental information related to this <info> element; e.g., an image or audio file</info> (2) Multiple occurrences MAY occur within a single <info> block</info>
resourceDesc	cap. alertInfoResource. resourceDesc. text	The text describing the type and content of the resource file (REQUIRED)	The human-readable text describing the content and kind, such as "map" or "photo," of the resource file.
mimeType	cap. alertInfoResource. mimeType. identifier	The identifier of the MIME content type and sub-type describing the resource file (OPTIONAL)	MIME content type and sub-type as described in [RFC 2046]. (As of this document, the current IANA registered MIME types are listed at http://www.iana.org/assignments/media- types/)

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
size	cap. alertInfoResource. size. integer	The integer indicating the size of the resource file (OPTIONAL)	Approximate size of the resource file in bytes.
uri	cap. alertInfoResource. uri. identifier	The identifier of the hyperlink for the resource file (OPTIONAL)	A full absolute URI, typically a Uniform Resource Locator that can be used to retrieve the resource over the Internet OR a relative URI to name the content of a <derefuri> element if one is present in this resource block.</derefuri>
derefUri	cap alertInfoResource. derefUri. data	The base-64 encoded data content of the resource file (CONDITIONAL)	 MAY be used either with or instead of the <uri> element in messages transmitted over one-way (e.g., broadcast) data links where retrieval of a resource via a URI is not feasible.</uri> Clients intended for use with one-way data links MUST support this element. This element MUST NOT be used unless the sender is certain that all direct clients are capable of processing it. If messages including this element are forwarded onto a two-way network, the forwarder MUST strip the <derefuri> element and SHOULD extract the file contents and provide a <uri> link to a retrievable version of the file.</uri></derefuri> Providers of one-way data links MAY enforce additional restrictions on the use of this element, including message-size limits and restrictions regarding file types.
digest	cap. alertInfoResource. digest. code	The code representing the digital digest ("hash") computed from the resource file (OPTIONAL)	Calculated using the Secure Hash Algorithm (SHA-1) per [FIPS 180-2]

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
3.2.4 "area"	Element and Sub	-elements	
area	cap. alertInfoArea. area. group	The container for all component parts of the area sub- element of the info sub- element of the alert message (OPTIONAL)	 Multiple occurrences permitted, in which case the target area for the <info> block is the union of all the included <area/> blocks.</info> MAY contain one or multiple instances of <polygon>, <circle> or <geocode>. If multiple <polygon>, <circle> or <geocode> elements are included, the area described by this <area/> is the union of those represented by the included elements.</geocode></circle></polygon></geocode></circle></polygon>
areaDesc	cap. alertInfoArea. area. text	The text describing the affected area of the alert message (REQUIRED)	A text description of the affected area.
polygon	cap. alertInfoArea. polygon. group	The paired values of points defining a polygon that delineates the affected area of the alert message (OPTIONAL)	 (1) Code Values: The geographic polygon is represented by a whitespace-delimited list of [WGS 84] coordinate pairs. (See WGS- 84 Note at end of this section.) (2) The first and last pairs of coordinates MUST be the same. (3) See Coordinate Precision Note at end of this section. (4) Multiple instances MAY occur within an <area/>.
circle	cap. alertInfoArea. circle. group	The paired values of a point and radius delineating the affected area of the alert message (OPTIONAL)	 (1) Code Values: The circular area is represented by a central point given as a [WGS- 84] coordinates pair followed by a space character and a radius value in kilometers. (See WGS-84 Note at end of this section.) (2) See Coordinate Precision Note at end of this section. (3) Multiple instances MAY occur within an <area/>.

Element Name	Context. Class. Attribute. Representation	Definition and (Optionality)	Notes or Value Domain
geocode	cap. alertInfoArea. geocode. code	The geographic code delineating the affected area of the alert message (OPTIONAL)	 (1) Any geographically-based code to describe message target area: <parameter></parameter> <valuename>valueName</valuename> <value>value</value> where the content of "valueName" is a userassigned string designating the domain of the code, and the content of "value" is a string (which may represent a number) denoting the value itself (e.g., valueName ="SAME" and value="006113"). (2) Values of "valueName" that are acronyms SHOULD be represented in all capital letters without periods (e.g., SAME, FIPS, ZIP). (3) Multiple instances MAY occur within a single <info> block.</info> (4) This element is primarily for compatibility with other systems. Use of this element presumes knowledge of the coding system on the part of recipients; therefore, for interoperability, it SHOULD be used in concert with an equivalent description in the more universally understood <polygon> and <circle> forms whenever possible.</circle></polygon>
altitude	cap. alertInfoArea. altitude. quantity	The specific or minimum altitude of the affected area of the alert message (OPTIONAL)	 (1) If used with the <ceiling> element this value is the lower limit of a range.</ceiling> Otherwise, this value specifies a specific altitude. (2) The altitude measure is in feet above mean sea level per the [WGS- 84] datum.
ceiling	cap. alertInfoArea. ceiling. quantity	The maximum altitude of the affected area of the alert message (conditional)	 (1) MUST NOT be used except in combination with the <altitude> element</altitude> (2) The ceiling measure is in feet above mean sea level per the [WGS- 84] datum.

220 **3.3 Implementation Notes**

221 3.3.1 WGS-84 Note

Geographic locations in CAP are defined using [WGS 84] (World Geodetic System 1984), equivalent to
 EPSG (European Petroleum Survey Group) code 4326 (2 dimensions). CAP does not assign
 responsibilities for coordinate transformations from and to other Spatial Reference Systems. See section
 1.5 Terminology for the format of coordinate pairs within CAP elements.

226 3.3.2 Security Note

Because CAP is an XML-based format, existing XML security mechanisms can be used to secure and
 authenticate its content. While these mechanisms are available to secure CAP Alert Messages, they
 should not be used indiscriminately.

230 Note that this section adds two tags to CAP by reference. These are: "Signature and "EncryptedData".

Both elements are children of the <alert> element and are optional. If the "EncryptedData" element

exists, no other elements will be visible until after the message is decrypted. This makes the minimal

233 CAP message an alert element which encloses an EncryptedData element. The maximal CAP message,

if an EncryptedData element is present is an <alert> element enclosing a single EncryptedData element

and a single Signature element.

236 3.3.2.1 Digital Signatures

237 The alert element of a CAP Alert Message MAY have an Enveloped Signature, as described by XML-

238 Signature and Syntax Processing **[XMLSIG]**. Other XML signature mechanisms MUST NOT be used in 239 CAP Alert Messages.

Processors MUST NOT reject a CAP Alert Message containing such a signature simply because they are
 not capable of verifying it; they MUST continue processing and MAY inform the user of their failure to
 validate the signature.

243 In other words, the presence of an element with the namespace URI [XMLSIG] and a local name of

"Signature" as a child of the alert element must not cause a processor to fail merely because of itspresence.

246 **3.3.2.2 Encryption**

The alert element of a CAP Alert Message MAY be encrypted, using the mechanisms described by XML Encryption Syntax and Processing **[XMLENC]**. Other XML encryption mechanisms MUST NOT be used in CAP Alert Messages; however, transport-layer encryption mechanisms may be used independently of this requirement.
