41 1 Introduction

42 The purpose of this document is to describe use-cases to demonstrate the Key Management
43 Interoperability Protocol (KMIP) ~~[KMIP-Spec]~~. The use-cases indicate if all concepts within the protocol
44 are sound and if the protocol is usable when implementing typical scenarios in real life. These use-cases
45 are not intended to fully test an implementation of KMIP. Thus, the use-cases do not contain typical
46 ~~Quality Assurance~~ scenarios which would stress an implementation. The use-cases are based on v1.0 of
47 the protocol.

48
49 The use-cases define a number of client-to-server request-response pairs for a number of operations. For
50 each request-response message pair the operation is stated, along with the relevant parameters needed
51 for the request or response message. This is followed by two different illustrations of the messages: first,
52 a human-readable construction which shows the fields tags, types and values, followed by the TTLV-
53 encoding of the message. These are included to facilitate the implementation of the message creation
54 and parsing functionality. The use-cases show one possible way to construct the messages, and the
55 messages shown are not necessarily the only correct constructions (e.g. it is possible to omit the attribute
56 index if it is zero). Also note that many values change dynamically when running the use-cases (the
57 server-generated timestamps, Unique Identifiers and key material in responses, as well as Batch Item ID
58 values in client-generated requests).

59 ~~In many situations in the use cases defined in this document, the server behavior depends on the server's~~
60 ~~policy. The illustrated message exchanges and their contents are not the only possible variants (see~~
61 ~~[KMIP-Spec]). E.g., the server response messages shown in this document correspond to a server policy~~
62 ~~of completely destroying a managed object, along with all of its attributes, when receiving a Destroy~~
63 ~~request.~~

64 ~~Multiple use cases describe several clients operating on the same managed object(s). For this to work,~~
65 ~~the clients SHALL have authenticated themselves to the server using the same credentials (see [KMIP-~~
66 ~~Prof]). Alternatively, the server policy applied to the relevant managed object(s) SHALL be such that the~~
67 ~~clients all have access to the managed object(s) in question.~~

74 2 Message exchange

75 The message exchange between clients and the server to test the following use-case scenarios is
76 performed with TTLV encoding over the ~~TLS/SSL~~ transport ~~as defined in [KMIP-Spec] and [KMIP-Prof]~~.

Deleted: This is to facilitate debugging and to focus on KMIP-specific issues instead of potential secure transport setup problems.

78 3 Centralized Management

79 3.1 Basic functionality

80 These use-cases test the basic features of KMIP including key creation, template ~~and secret data~~
81 registration, attribute functionality, access methods, and batch operation.

83 **3.1.1 Use-case: Create / Destroy**

84 In this use-case the client issues a Create request, whereby the server creates a new symmetric key and
 85 returns the Unique Identifier. To clean up, the client then performs a Destroy operation to destroy the key.

89 **3.1.2 Use-case: Register / Create / Get attributes / Destroy**

90 Here the client first registers a template object and then creates a symmetric key using the registered
 91 template. To verify that the attributes of the key were set correctly from the template, the client then
 92 issues a Get Attributes command, after which it destroys first the key and then the template.

96 **3.1.3 Use-case: Create / Locate / Get / Destroy**

97 This use-case tests the Locate and Get operations, in addition to the previously used operations Create
98 and Destroy. A symmetric key is first created, and then a lookup is performed on the Name attribute using

99 the Locate operation. Subsequently, a Get request is issued to retrieve the located key, after which the
 100 key on the server is destroyed.

104 **3.1.4 Use-case: Dual client use-case, ID Placeholder linked Locate & Get batch**

105 This use-case has two clients performing operations on the same key. The first client initially registers a
106 template and creates a symmetric key using that template. The second client then does a batched Locate
107 and Get using the ID Placeholder to retrieve the key. The second client thereafter performs a number of
108 operations on the key (Get Attribute List, Get Attribute, Add Attribute, Modify Attribute and Delete
109 Attribute), before the first client finally destroys the key and the template. The first client also tries to Get
110 the key and the template after they have been destroyed, but the Get operation fails in both cases.

111
112 This use-case demonstrates the fact that it is possible for two clients to cooperate and use the same
113 managed object while only having knowledge of a single pre-agreed Name attribute value and without
114 having to share any other information.

115

Deleted: Here, the identities of the two clients are not considered and since we do not include an Authentication field in the header, they could also be considered to be the same client. If the clients authenticate themselves to the server using different credentials, the server needs to employ another policy than the Default policy defined in the KMIP specification on the key object to allow both clients to access it.

3.1.5 Use-case: Register / Destroy Secret Data

In this use-case the client issues a Register request containing a Secret Data object, whereby the server registers the object and returns the Unique Identifier. To clean up, the client then performs a Destroy operation to destroy the object.

Formatted: Bullets and Numbering

Time	Request/Response messages

124 **3.2 Use-case: Asynchronous Locate**

125 This use-case tests the asynchronous capabilities of KMIP using the Locate operation. A key is created
126 and then a Locate request is sent containing the Name of the created key and with the message header
127 Asynchronous Indicator-field set to True. If the server returns an asynchronous response to the Locate,
128 the client then polls the server until the operation is ready. If the server responded asynchronously, a
129 subsequent Locate operation that is also handled asynchronously is then Cancelled, before the key is
130 finally destroyed.

131
132 This use-case shows the use of two clients with the same assumptions as in the use-case described in
133 Section 3.1.4. Since the client is unable to force the server to respond asynchronously, it is possible for a
134 server to respond synchronously to the requests issued at times 1 and 4, in which case the expected
135 response are the ones shown at times 2 and 5, respectively. In the case of the server not responding

Deleted: 3.1.4

136 asynchronously to the Locate requests, the client is permitted to skip the requests illustrated at time 7 and
 137 8.

142 **4 Key life cycle support**

143

144 **4.1 Use-case: Revoke scenario**

145 This use-case tests the revocation aspect of the key life cycle support in KMIP. A key is created and a
 146 Get Attribute for the State-attribute reveals that the key is in Pre-active state. The Activation Date is then
 147 set, which changes the state to Active. The key is then revoked with a revocation reason of Compromised
 148 and the state subsequently changed to Compromised, but this does not stop a client from being able to
 149 add, modify and delete attributes or even get the key (since we assume here that the out-of-band
 150 registration has been used to make the server aware of the fact that the client is capable of interpreting
 151 the attributes of the key and determining what it is allowed to do with the key). To clean up, the created
 152 key is finally destroyed.

5 Auditing and reporting

5.1 Use-case: Get usage allocation scenario

This use-case tests the usage management functionality of KMIP. A key is created and the Activation Date and Protect Stop Date attributes are set in such a way as to allow the Get Usage Allocation operation to be performed. The value of the Usage Limits attribute is set to 1000 bytes, and two subsequent requests for 500 bytes succeed (one of them also verifying the amount that can be received using the Check operation), while a third fails since the usage allocation has been used up. The key is finally destroyed. This use-case shows the use of multiple clients with the assumptions regarding the clients being the same as in the use-case described in Section 3.1.4

6.1 Use-case: Import of a Third-party Key

172

173 This use-case tests the import of a foreign key using the Register operation. To validate that the
 174 registered key is treated the same as a locally created key, an attribute is added to the key and then
 175 modified. Finally, the key is destroyed.

7 Vendor Extensions

181 These use-cases test the handling of unknown message extensions with vendor-specific content.
182

7.1 Use-case: Unrecognized Message Extension with Criticality Indicator false

185 A create request is issued and the request contains a Message Extension with the Criticality Indicator set
186 to false. The server does not understand the extension, but since it is non-critical, the create request is
187 processed normally. Subsequently, the created key is deleted.

191 **7.2 Use-case: Unrecognized Message Extension with Criticality Indicator**
192 **true**

193 A create request is issued and the request contains a Message Extension with the Criticality Indicator set
194 to true. The server does not understand the extension, and since it is critical, the create request fails and
195 an error is returned.

201 Creation of keys using “Create Key Pair” operation, locating pair using Link attribute.

8.1 Use-case: Create a Key Pair

202 Create a new private/public key pair. Make sure they are linked correctly by issuing Locate commands with the assigned Unique Identifiers. Finally delete both key halves.

9 Key Roll-over

214
215

216 These use-cases test manual key roll-over using the “Re-key” operation. In particular, they test the
217 formatting of the Re-key command, the handling and server-side processing of the various Time
218 attributes and the setting of some other attributes that are not automatically copied from the existing key
219 to the new key.

9.1 Use-case: Create a Key, Re-key

220
221 Create a symmetric key with a specific name, and then use Locate to find the key. After using Re-key to
222 create a new key, verify that the name was removed from the existing key and copied to the new key.
223 Also verify that the key material for the old key is still retrievable. To clean up, both keys are deleted.

227 9.2 Use-case: Existing Key Expired, Re-key with Same lifecycle

228 | Create a new symmetric key. Then add the *Activation Date* and *Deactivation Date* attributes based on the
229 timestamp in the response to the Create request. The *Activation Date* is set to a time in the past and the
230 *Deactivation Date* to a time in the near future. Repeated Get Attribute calls are performed to verify that
231 the state is first "Active", then subsequently "Deactivated". Then issue a Re-key request, including an
232 *Activation Date* attribute with the value set to the previously specified *Deactivation Date* of the existing
233 key. Verify from the response that the *Activation Date* and *Deactivation Date* attributes were set correctly
234 (if they are not returned, issue a Get Attribute request). Do a Get Attribute operation to verify that the
235 state of the new key is "Active". To clean up, both keys are deleted.

238 9.3 Use-case: Existing Key Compromised, Re-key with same lifecycle

239 Create a new symmetric key with the *Activation Date* in the past. Do a Get Attribute operation on the
240 State attribute to verify the key is “Active”. Then revoke the key as compromised, verify that the state has
241 changed to “Compromised”. Create a replacement key using Re-key with the offset set to '0' to indicate
242 that the times are to be copied from the existing key. Do a Get Attribute operation to verify that the state
243 of the new key is “Active”. To clean up, both keys are deleted.

247 **9.4 Use-case: Create key, Re-key with new lifecycle**

248 Create a symmetric key with a specific name, then use Locate to find the key. After using Re-key to
 249 create a new key, verify that the name was removed from the existing key and copied to the new key. To
 250 clean up, both keys are deleted.

254 **9.5 Use-case: Obtain Lease for Expired Key**

255 Create a symmetric key with a specific name and obtain a lease. Revoke the key with state
 256 "Compromised" and re-key the key. Try to obtain a lease on the old key which fails. Locate the new key
 257 with the original name. Get the new key and obtain a lease.

260 10 Archival

261

262 These use-cases test archiving and locating keys using the off-line indicator. If the server performs the
 263 Archive and Recover operations asynchronously, the client Polls the server until the operations complete.
 264 The client indicates in the request that it supports asynchronous responses.

265 10.1 Use-case: Create a Key, Archive and Recover it

266 Create a symmetric key with a specified name, then use Locate to find the key and get the key. Archive
 267 the key (asynchronous operation, use Poll until it completes) and use Get and Locate on it, but both fail.
 268 Add the Storage Status Mask to the Locate-command, indicating to the server to search in both online
 269 and archived storage. The Locate finds the key. Recover the key from the archive (also asynchronous),
 270 both Locate and Get succeed.

These use-cases test attributes and objects related to access control and server policy.

11.1 Use-case: Credential, Operation Policy, Destroy Date

278

279

280

281

282

283

284

Pass a Credential object in the message header in all requests for identification purposes (how the Credential object is used is defined in [KMIP-Prof]). Create a symmetric key and set the Operation Policy Name attribute to "Default". Using another Credential, attempt to perform a Get operation batched with a Get Attribute List on the created symmetric key – according to the Default Operation Policy, both these request SHALL fail, and with the Batch Error Continuation Option set to "Continue", the client SHALL also receive both response payloads. Using the initially used Credential, destroy the object and get the Destroy Date attribute.

285

286

287

288

289

290

291

The message exchanges in this use case are based on a certain server policy (e.g. handling of Credentials) that in some aspects differs from the policy assumed in earlier use cases (e.g. in this use case, the Destroy Date is retained). As mentioned in Section **Error! Reference source not found.**, the message exchanges shown in this document are not the only correct alternatives. The Credentials shows here are only one interpretation of the Username & Password credential type – the exact format of this credential may vary from one system to another.

12 Query, Maximum Response Size

Formatted: Bullets and Numbering

This use case tests the Query operation and the Maximum Response Size header field.

Formatted: Bullets and Numbering

12.1 Use-case: Query, Maximum Response Size

Perform a Query operation, querying the Operations and Objects supported by the server, with a restriction on the Maximum Response Size set in the request header. Since the resulting Query response

300 is too big, an error is returned. Increase the Maximum Response Size, resubmit the Query request, and
 301 get a successful response.

305

306 The following individuals have participated in the creation of this specification and are gratefully
307 acknowledged:

308 **Original Authors of the initial contribution:**

309 David Babcock, HP
310 Joseph Birr-Pixton, Thales/nCipher
311 Mathias Björkqvist, IBM (editor)
312 John Clark, HP
313 Stan Feather, HP
314 Jon Geater, nCipher
315 Bob Griffin, EMC
316 Robert Haas, IBM
317 Jack Harwood, EMC
318 Vlad Libershteyn, HP
319 Mark Lin, EMC/RSA
320 Brian Metzger, HP
321 Madhav Mutalik, EMC/RSA
322 Anthony Nadalin, IBM
323 René Pawlitzek, IBM (editor)
324 Bruce Rich, IBM
325 Parameswaran Seshan, EMC/RSA
326 John Tattan, EMC

327 **Participants:**

328 Gordon Arnold, IBM
329 Todd Arnold, IBM
330 Matthew Ball, Sun Microsystems
331 Elaine Barker, NIST
332 Peter Bartok, Venafi, Inc.
333 Mathias Björkqvist, IBM
334 Kevin Bocek, Thales e-Security
335 Kelley Burgin, National Security Agency
336 Jon Callas, PGP Corporation
337 Tom Clifford, Symantec Corp.
