UN/CEFACT – ebXML Business Process Specification Schema 18 October 2003 Version 1.10

15 **1 Status of This Document**

16 This UN/CEFACT-Technical Specification has been developed in accordance with the

17 UN/CEFACT/TRADE/22 Open Development Process (ODP) for Technical Specifications.

18 This document has been approved by the United Nations Centre for Trade Facilitation and

- 19 Electronic Business (UN/CEFACT) Techniques and Methodology Group (TMG) for
- 20 promulgation as a UN/CEFACT Technical Specification in accordance with the ODP.
- 21
- 22 Distribution of this document is unlimited.
- 23
- 24 This "Approved" (For Implementation) version: UN/CEFACT ebXML Business Process
- 25 Specification Schema, Version 1.10 of 18 October 2003
- 26
- 27 Previous Draft (For Review) version: UN/CEFACT ebXML Business Process Specification
- 28 Schema Version 1.09 of 25 August 2003
- 29
- 30 Previous "Approved" (For Implementation) version: *ebXML Business Process Specification*
- 31 Schema Version 1.01 of 11 May 2001

134 **3 Introduction**

135 **Executive Summary**

136 137 The ebXML Business Process Specification Schema technical specification defines a 138 standard language by which business systems may be configured to support 139 execution of business collaborations consisting of business transactions. It is based upon prior UN/CEFACT work, specifically the metamodel behind the UN/CEFACT 140 141 Modeling Methodology (UMM) defined in the "UN/CEFACT Modeling Methodology -Meta Model - Revision 12 (2003-01-17)" specification. 142 143 The BPSS technical specification supports the specification of Business Transactions 144 and the choreography of Business Transactions into Business Collaborations. Each Business Transaction can be implemented using one of many available standard 145 patterns. These patterns are defined in the UMM specification. A pattern is not 146 executable, it rather specifies the type of the message exchange (request, response 147 148 and signals) that applies for a given business transaction definition. It is a way to 149 define classes of business transaction definitions. These patterns could potentially be related to different classes of electronic commerce transactions. 150 The current version of the BPSS technical specification addresses collaborations 151 152 between two parties (Binary Collaborations). Collaborations involving more than two business partners (Multiparty Collaborations) have been deprecated. 153

154 **3.1** Summary of Contents of Document

- 155 This document describes the ebXML Business Process Specification Schema.
- 156This document describes it in its UML form and provides the corresponding XML157Schema which every BPSS instance must conform to.
- 158The document first introduces general concepts and semantics, then applies these159semantics in a detailed discussion of each part of the model. The document then160specifies all elements in the UML form, and then in XML form.
- 161 The keywords MUST, MUST NOT, REQUIRED, SHALL, SHALL NOT, SHOULD, 162 SHOULD NOT, RECOMMENDED, MAY, and OPTIONAL, when they appear in this 163 document, are to be interpreted as described in RFC 2119 [Bra97].
- 164

165 **3.2 Audience**

- 166The primary audience is technical implementers of ebXML. We define a business167process analyst as someone who applies the UN/CEFACT Modeling Methodology168(UMM) which defines a process that centers around interviewing business people.
- An additional audience are designers of business process definition tools who need
 to specify the conversion of user input in the tool into the XML representation of the
 Specification Schema.

172 3.3 Related Documents

- 173As mentioned above, other documents provide detailed definitions of some of the174components of the ebXML Business Process Specification Schema and of their inter-175relationship. They include ebXML Specifications on the following topics:
- 176
- ebXML Technical Architecture Specification, version 1.04
- UN/CEFACT Core Components Dictionary, version 1.04
- ebXML Naming Convention for Core Components, version 1.04
- ebXML Collaboration-Protocol Profile and Agreement Specification V2.0
- ebXML Business Process and Business Information Analysis Overview, version 1.0
- ebXML Business Process Analysis Worksheets & Guidelines, version 1.0
- ebXML E-Commerce Patterns, version 1.0
- ebXML Catalog of Common Business Processes, version 1.0
- ebXML Message Service Specification V2.0
- UN/CEFACT Modeling Methodology (UMM) as defined in the N090R12 specification

189 **3.4 Prerequisites**

190It is assumed that the audience will be familiar with or have knowledge of the191following technologies and techniques:

- Business process modeling techniques and principles as defines in UN/CEFACT's Modeling Methodology (UMM)
- The UML syntax and semantics
- The Extensible Markup Language (XML)

196 **4 Design Objectives**

197 4.1 Goals/Objectives/Requirements/Problem Description

- BPSS Instances describe interoperable business processes that allow
 business partners to collaborate. These models must be executed by
 software components that collaborate on behalf of the business partners.
- 201The goal of the ebXML Business Process Specification Schema is to provide202the bridge between e-business process modeling and specification of e-203business software components.
- 204The ebXML Business Process Specification Schema technical specification205provides for the nominal set of specification elements necessary to specify a206collaboration between business partners, and to provide configuration207parameters for the partners' runtime systems in order to execute that208collaboration between a set of e-business software components.
- A business process specification created with the ebXML Business Process Specification Schema is referred to as a BPSS instance.
- 211The ebXML Specification Schema is available as an XML Schema212(<u>http://www.w3.org/2001/XMLSchema</u>) format at this loacation:
- 213 http://www.untmg.org/downloads/General/approved/BPSS-v1pt10.xsd. A
- 214UML description of elements of the schema is found in relevant sections of215this document.
- 216The UML version of the *ebXML Business Process Specification Sch*ema is217merely a UML Class Diagram. It is not intended for the direct creation BPSS
- instances. Rather, it is a self-contained statement of all the specification
 elements and relationships required to be able to create an ebXML compliant
 Business Process Specification. Any methodologies and/or metamodels used
 for the creation of ebXML compliant Business Process Specifications must at
 minimum support these elements and relationships.
- 223 The XML Schema provides the specification for XML based BPSS instances.
- 224The UML and XML based representations of the *ebXML Business Process*225Specification Schema are unambiguously mapped to each other.

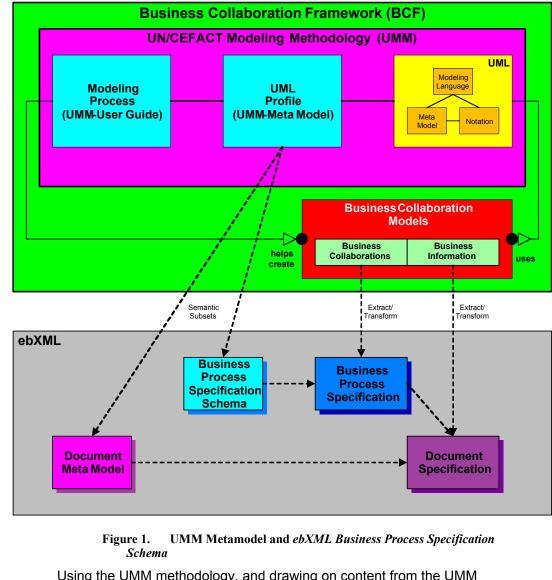

226 **4.2 Caveats and Assumptions**

- This technical specification is designed to specify the run time aspects of a business collaboration.
- It is recommended that the preferred methodology for creating an ebXML
 BPS shall be UN/CEFACT Modeling Methodology (UMM).
- 231The ebXML Business Process Specification Schema does not by itself define232Business Documents Structures. It is intended to work in conjunction with233already existing Business Document definitions, and/or the document234metamodel defined by the UN/CEFACT Core Components specifications.

4.2.1 Relationship between *ebXML Business Process Specification Schema* and UMM

- 237
- The UN/CEFACT Modeling Methodology (UMM) is a set of architectures,
- methodologies, business semantics, ontologies and reference models. The
- 240 UMM offers a formal methodology for describing any Open-edi scenario as

- 241 defined in ISO/IEC 14662, Open-edi Reference Model. Examples of an Open-242 edi scenario are purchasing and inventory management. The primary scope 243 of the UMM is to provide "a perspective of business transactions limited to 244 those aspects regarding the making of business decisions and commitments 245 among organizations, which are needed for the description of a business 246 transaction". The UMM provides a procedure for specifying (modelling) 247 business processes involving information exchange in a technology neutral, 248 implementation-independent manner.
- This section describes the relationship between UMM and the ebXML
 Business Process Specification Schema.
- 251 The UMM Meta Model is a description of business semantics that allows 252 Trading Partners to capture the details for a specific business scenario (a 253 Business Process) using a consistent modeling methodology. A Business 254 Process specification describes in detail how Trading Partners take on shared 255 roles, relationships and responsibilities to facilitate interaction with other 256 Trading Partners. The interaction between roles takes place as a 257 choreographed set of Business Transactions. Each Business Transaction is 258 expressed as an exchange of electronic Business Documents. The 259 sequence of the exchange is determined by the Business Process, and by 260 messaging and security considerations. Business Documents are composed 261 from re-useable Business Information Entities, expressed in an appropriate 262 format (XML, EDI, UBL, ...). At a lower level, Business Processes can be composed of re-useable Common Business Processes, and Business 263 264 Information Entities can be composed of re-useable Core Components. 265 Common Business Processes and Business Information Entities reside in a 266 UMM Business Library.
- 267 The UMM Meta Model supports a set of Business Process viewpoints that 268 provide a set of semantics (vocabulary) for each viewpoint and forms the 269 basis for specification of the semantics and artifacts that are required to 270 facilitate business process and information integration and interoperability. 271 Using the UMM methodology and the UMM metamodel, the user may thus 272 create a complete Business Process and Information Model. This model 273 contains more information than what is required for configuring ebXML 274 compliant software. Also the model is syntax independent and not directly 275 interpretable by ebXML compliant software.
- 276 The *ebXML* Business Process Specification Schema provides an additional 277 view of the UMM metamodel. This subset is provided to support the direct 278 specification of the nominal set of elements necessary to configure a runtime 279 system in order to execute a set of ebXML business transactions. By drawing 280 out modeling elements from several of the other views, the ebXML Business 281 Process Specification Schema forms a semantic subset of the UMM Meta Model. Using the *ebXML Business Process Specification Schema* the user 282 283 may thus create a Business Process Specification that contains only the 284 information required to configure ebXML compliant software, while other 285 modeling elements of the UMM could be used to configure other software 286 components such as a business process management system (BPMS).
- It is expected that ebXML compliant software will be configured with XML
 instances conforming to the ebXML Business Process Specification Schema.
- 289The relationship between the UMM Meta Model and the *ebXML Business*290*Process Specification Schema* is shown in Figure 1.

291

294

295

Using the UMM methodology, and drawing on content from the UMM Business Library a user may create complete Business Process and

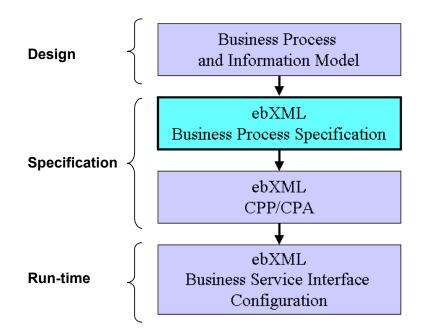

- 296 Information Model conforming to the UMM metamodel.
- 297 Since the ebXML Business Process Specification Schema is a semantic 298 subset of the UMM metamodel, the user may then in an automated fashion 299 extract from the Business Process and Information Model the required set of 300 elements and relationships, and transform them into a BPSS instance 301 conforming to the *ebXML* Business Process Specification Schema.
- 302 Likewise, since the UN/CEFACT Core Component (CC) document 303 metamodel is aligned with the UMM Metamodel, the user may then in an 304 automated fashion extract from the Business Process and Information Model 305 the required set of elements and relationships, and transform them into an 306 ebXML document model conforming to UN/CEFACT Core Component 307 specifications.
- 308 The UN/CEFACT UMM and CC Specification are not part of the formal set of 309 ebXML specifications.

- 310 The remainder of this document focuses on the *ebXML Business Process*
- 311 Specification Schema and Business Process Specifications created with it. It
- recommended that proper Business Process and Information Modeling using the UMM has taken place prior to beginning the activity of creating a 312
- 313
- Business Process Specification. 314

316 **5 Language Overview**

317	The ebXML Business Process Specification Schema defines a standard
318	language for business process specification. As such, it works with the

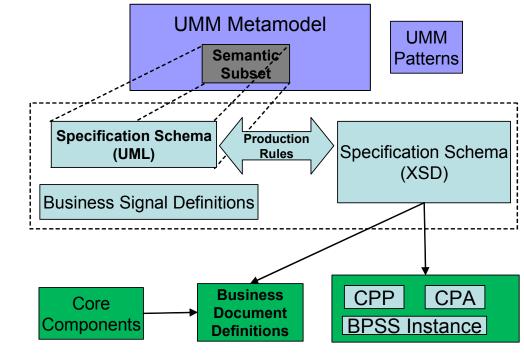

- ebXML Collaboration Protocol Profile (CPP) and Collaboration Protocol
- 320 Agreement (CPA) specifications to bridge the gap between Business Process
- 321 Modeling and the configuration of ebXML compliant e-commerce software.

322

323 Figure 2: Business Process Specification and Business Service Interface Configuration 324 Using Business Process Modeling, a user may create a complete Business 325 Process and Information Model. 326 Based on this Business Process and Information Model and using the ebXML 327 Business Process Specification Schema the user will then extract and format 328 the nominal set of elements necessary to configure an ebXML runtime 329 system in order to execute a set of ebXML business transactions. The result is a BPSS instance. 330 331 Alternatively the ebXML BPSS instance may be created directly, without prior 332 explicit business process modeling. 333 A BPSS instance contains the specification of Business Transactions and the choreography of these Business Transactions into Business Collaborations. 334 335 This BPSS instance is then the input to the formation of ebXML trading partner Collaboration Protocol Profiles and Collaboration Protocol 336 337 Agreements. 338 These ebXML trading partner Collaboration Protocol Profiles and 339 Collaboration Protocol Agreements in turn serve as configuration files for

340 Business Service Interface (BSI) software component. The Business Service Interface Software represents any ebXML compliant component, which is 341 342 able to be, configured from an ebXML BPSS instance and a CPA. 343 The architecture of the ebXML Business Process Specification Schema technical specification consists of the following functional components: 344 345 UML representation of the Business Process Specification Schema 346 semantics 347 XML Schema definition of the Business Process Specification • Schema. Each BPSS instance must conform to this schema definition. 348 349 Production Rules defining the mapping from the UML representation 350 of the Business Process Specification Schema to the XML Schema 351 version 352 **Business Signal Definitions** 353 354 Together these components allow you to specify the run time aspects of a 355 business process model within the limitations of this current version of the BPSS. However, all the parameters of the ebXML Business Process 356 357 Specification Schema are intented to be specified at design time. None of 358 these parameters are specified or inferred at run-time. 359 These components are shown (inside the dotted box) in figure 3 below. 360

362Figure 3: Relationship of *ebXML Business Process Specification Schema* to UMM,363CPP/CPA and Core Components

364

361

365The following provides a description of each of the components in the ebXML366Business Process Specification Schema and their relationship to UMM, and367UN/CEFACT Core Component and CPP/CPA:

368 **5.1 UML Representation of Business Process Specification** 369 **Schema**

The UML representation of the *ebXML Business Process Specification Schema* is a semantic subset of the metamodel behind UMM as specified in
UN/CEFACT Modeling Methodology - Meta Model - Revision 12 (2003-01The UML representation of the ebXML *Business Process Specification Schema* is a UML Class Diagram.

375 5.2 XML Schema representation of Business Process 376 Specification Schema

- 377The corresponding XML Schema representation of the ebXML Business378Process Specification Schema provides the specification for XML based379instances of ebXML BPSS, and as a target for production rules from other380representations. Thus, a user may either create a BPSS instance directly as381an XML document, or may chose to use some other means of specification382first and then apply production rules to arrive at the XML document version.
- Any methodologies and/or metamodels used for the creation of ebXML BPSS
 instances must at a minimum support the production of the elements and
 relationships contained in the XML representation of the ebXML Business
 Process Specification Schema technical specification.
- 387This XML Schema definition is isomorphic to the UML representation of the
ebXML Business Process Specification Schema.

389 **5.3 UMM Business Process Interaction Patterns**

- Any ebXML Business Service Interface software components should be able
 to be configured to execute the business processes specified in a *BPSS instance*. They do so by exchanging ebXML messages and business signals.
- Each Business Transaction can be implemented using one of many available
 standard patterns. These patterns determine the actual exchange of
 messages and business signals between the partners to achieve the required
 electronic commerce transaction.
- 397 The Business Transaction Interaction Patterns set forth in the UN/CEFACT
- 398 Modeling Methodology illustrate recommended permutations of message
- 399 sequences as determined by the type of business transaction defined and the
- 400 timing policies specified in the transactions. While the UMM patterns
- 401 themselves are not part of the ebXML specifications, all the security and
- 402 timing parameters required to express the pattern properties are provided as 403 attributes of elements in the ebXML *Business Process Specification Schema*.

404 5.4 Business Signal Definitions

- 405 A business signal is an object that is transmitted back to an activity that 406 initiated the transfer of execution control. Business signals have specific
- 407 business purpose and are separate from lower protocol and transport signals
- 408 as specified in the ebXML Message Service Specification. The state of a
- 409 given business transaction activity instance can be explicitly calculated at 410 run-time by evaluating these signals. As such they are instrumental in
- 410 run-time by evaluating these signals. As such they are instrumental if 411 establishing a business collaboration protocol that garantees that the
- 412 representation of the state of a business collaboration instance for each party,

- 413 is the strictly identical for both parties. This is what we reference as "state alignment".
- The structures of ebXML business signals are 'universal' and do not vary
 from transaction to transaction. Thus, they can be defined once and for all.
 These schemas are included in the ebXML *BPSS technical specification*itself.
- 419 The Business Process Specification provides both the choreography of 420 business signals, and the structure definition of the business payload of a 421 business signal. The ebXML Message Service Specification provides a 422 reliable messaging infrastructure upon which the ebXML BPSS technical 423 specification builts its protocol for business state alignment via the use of 424 business signals. The business signal payload structures provided herein are 425 optional and normative and are intended to provide business and legal 426 semantics to the business signals.
- 427 A Schema is provided for each of the possible business signals.

428 5.5 Production Rules

- A set of production rules is provided, defining the mapping from the UML
 version of the ebXML *Business Process Specification Schema* to the XML
 version.
- 432 The primary purpose for these production rules is to govern the one-time
- 433 generation of the Schema representation of the ebXML *Business Process*
- 434 Specification Schema from the UML Class Diagram version of the ebXML
- 435 Business Process Specification Schema.

436 5.6 Relationship to CPP/CPA

437 A BPSS instance is, along with protocol specifications, the object of the 438 agreement between two parties. The BPSS instance is therefore incorporated 439 with or referenced by ebXML trading partner Collaboration Protocol Profiles 440 (CPP) and Collaboration Protocol Agreements (CPA). Each CPP declares its 441 support for one or more Roles within the BPSS instance. A BPSS instance is 442 also a machine interpretable specification needed for an ebXML Business 443 Service Interface, which will enforce its definition at run-time. The CPP 444 profiles and CPA agreements contain further technical parameters resulting in 445 a full specification of the run-time software at each trading partner.

446 **5.7** *Relationship to Business Documents*

447The Business Process Specification Schema does not by itself support the448definition of Business Documents. Rather, a BPSS instance merely points to449the definition of Business Documents. Such definitions may either be XML450based, or – as attachments – may be any other structure, or completely451unstructured.

452 **5.8** Relationship to ebXML Message Service Specification

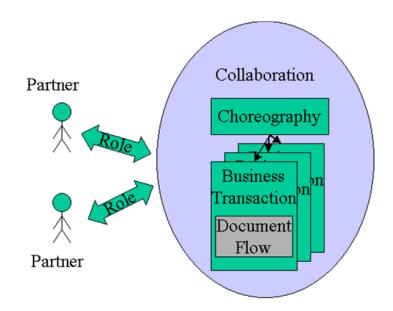

The Business Process Specification Schema will provide choreography of
business messages and signals. The ebXML Message Service Specification
provides the infrastructure for message / signal identification, typing, and
integrity; as well as placing any one message in sequence with respect to
other messages in the choreography.

459 5.9 Key Concepts of the ebXML Business Process 460 Specification Schema

461

462The ebXML Business Process Specification Schema specifies the structure463and semantics of machine processable business collaborations definitions.464These semantics are aligned with the one of UMM and represent a subset of465the UMM semantics.

466 At a high level a business collaboration consists of a set of roles collaborating
467 through a set of choreographed transactions by exchanging business
468 documents.

469

470	Figure 4. Ilustration of the basic semantics of a business collaboration
471	
472 473 474 475 476 477 478	Two or more business partners participate in the business collaboration through roles. The roles always exchange messages in the context of Business Transactions. Each Business Transaction consists of one or two predefined Business document flows. One or more Business Signals may additionally be exchanged as part of a Business Transaction to ensure state alignment of both parties. The business transactions are performed relative to each other as part of a choreography.
479	These basic semantics of a business collaboration are illustrated in Figure 4.
480 481	The following section describes the concepts of a Business Collaboration, a Business Transaction, a Business document flow, and Choreography

. . . .

- 482 1. Business Collaborations
- 483 A business collaboration is a set of Business Transactions between
 484 business partners. Each partner plays one or more roles in the
 485 collaboration.
- The ebXML *Business Process Specification Schema* supports two levels
 of business collaborations, Binary Collaborations and Multiparty
 Collaborations.
- 489 Binary Collaborations are between two roles only.
- 490 Multiparty Collaborations are between more than two roles, but such 491 Multiparty Collaborations are always synthesized from two or more Binary 492 Collaborations. For instance if Roles A, B, and C collaborate and all 493 parties interact with each other, there will be a separate Binary 494 Collaboration between A and B, one between B and C, and one between 495 A and C. The Multiparty Collaboration will be the synthesis of these three 496 Binary Collaborations. The concepts developed to specify multi-party collaboration are experimental and are being deprecated. It is 497 498 recommended not to use this capability of the specification as it might 499 change substantially in future releases. The implementation of this feature 500 is therefore optional for any compliant ebXML Business Service Interface.
- 501 Binary Collaborations are expressed as a set of Business Activities 502 between the two roles. The Business Activity can be a Business 503 Transaction Activity, i.e. the activity of conducting a single Business 504 Transaction, or a Collaboration Activity, i.e. the activity of conducting 505 another Binary Collaboration. An example of the former is the activity of 506 "process purchase order". An example of the latter is the activity of 507 "negotiating a contract". In either case the activities can be 508 choreographed relative to other activities as per below.
- 509 The ability of a Binary Collaboration to have activities that in effect are 510 executing other Binary Collaborations is the key to recursive compositions 511 of Binary Collaboration, and to the re-use of Binary Collaborations. An 512 activity, whether it is a Business Transaction Activity or a Collaboration 513 Activity represents the usage of a definition within a Binary Collaboration 514 Specification. For instance, a Business Transaction is defined once and 515 for all, but could appear several times - as a Business Transaction Activity -, sometimes even with opposite roles, within the same binary 516 517 collaboration definition.
- 518In essence each Binary Collaboration is a re-useable protocol between519two roles.
- 520 2. Business Transactions

521 A Business Transaction represents an atomic unit of work in a trading 522 arrangement between two business partners. The scope of the BPSS 523 technical specification is not to cover how BPSS Business Transactions 524 are related to trading activities between business partners. This is the role 525 of the UMM. A Business Transaction is conducted between two parties 526 playing opposite roles in the transaction. The roles are always a 527 requesting role and a responding role. They are not specific roles like 528 buyer or seller. These roles will be specified at the Business Transaction 529 Activity level, when the Business Transaction definition is used for a 530 specific purpose.

- 531Like a Binary Collaboration, a Business Transaction is a re-useable532protocol between two roles. The way it is re-used is by referencing it from533a Binary Collaboration through the use of a Business Transaction Activity534as per above. In a Business Transaction Activity the roles of the Binary535Collaboration are assigned to the execution of the Business Transaction.
- 536Unlike a Binary Collaboration, however, the Business Transaction is537atomic; it cannot be decomposed into lower level Business Transactions538that could be reused independently of each other.
- 539A Business Transaction is a very specialized and very constrained540protocol, in order to achieve very precise and enforceable transaction541semantics. These semantics are expected to be enforced by the software542managing the transaction, i.e. an ebXML Business Service Interface (BSI)543software component.
- 544 A Business Transaction will always either succeed or fail both from a 545 protocol and a business perspective. If it succeeds from both 546 perspectives it may be designated as legally binding between the two 547 partners, or otherwise govern their collaborative activity. If it fails it is null 548 and void, and each partner must relinguish any mutual claim established 549 by the transaction. In addition, if it fails from protocol perspective, each 550 party must synchronize their state to the state prior the start of the 551 transaction. For instance, a purchase order state should advance to "sent" 552 when and only when a protocol success is reported by the BSI. In case of 553 a business failure, the state has already been "synchronized" and it is the 554 duty of each application to take the proper actions. A Business failure is 555 any failure that is identified by an application during the processing of the business document(s) and based on information not available to the 556 557 BPSS. For instance, a "reject purchase order" response document would be considered as a business failure. In this case, it is the role of the 558 559 applications to mark the state of the purchase order appropriately.
- 560 3. Business Document flows
- 561A business transaction is realized as Business Document flows between562the requesting and responding roles. There is always a requesting563Business Document, and optionally a responding Business Document,564depending on the desired transaction configuration: e.g. one-way565notification vs. two-way conversation.
- 566Actual document definition is achieved using the UN/CEFACT Business567Collaboration Models, or by some methodology external to ebXML but568resulting in Schema definition (XSD or DTD) that an ebXML Business569Process Specification can point to.
- 570 4. Choreography
- 571 The Business Collaboration Choreography describes the ordering and 572 transitions between business transactions or sub collaborations within a 573 binary collaboration. For example, in a UML tool this could be 574 represented with a UML activity diagram. Actually, the choreography is 575 specified in the ebXML Business Process Specification Schema using 576 activity diagram concepts such as: start state, completion state, activities, 577 forks, joins, decisions, transitions between activities, and guards on the 578 transitions. However, it is beyond the scope of this document to specify a 579 notation of a business collaboration.
- 580 5. Patterns

- 581 The ebXML *Business Process Specification Schema* provides a set of 582 unambiguous semantics, as a subset of UMM semantics, which enable us 583 to specify transactions and collaborations. Within these semantics the 584 user community has flexibility to specify an infinite number of specific 585 transactions and collaborations. The use of predefined patterns combines 586 this flexibility with a consistency that facilitates faster design, faster 587 implementation, and enables generic processing.
- 588A set of predefined transaction interaction patterns, defining common589combinations of transaction interaction parameter settings can be found in590the UMM.
- 591While the UMM transaction interaction patterns themselves are not part of592the ebXML BPSS technical specification, all the security and timing593parameters required to express the pattern properties are provided as594attributes of elements in the Business Process Specification Schema.
- 595It is also anticipated that patterns for collaboration choreographies will596emerge. An example of such a pattern is in the ebXML E-Commerce597Patterns.
- 598 Re-use, recursion, and patterns are among the key concepts of the ebXML 599 *Business Process Specification Schema*. The following section will illustrate
- 600 these key concepts.

5.10 How to use the ebXML Business Process Specification Schema

- 604The ebXML Business Process Specification Schema should be used605wherever ebXML compliant software is being specified to execute Business606Collaborations.
- 607The ebXML Business Process Specification Schema is used to specify the608business process related configuration parameters for configuring a BSI to609execute these collaborations.

610 This section discusses

- How the ebXML *Business Process Specification Schema* fits in with other ebXML specifications.
- How to use the ebXML *Business Process Specification Schema* at design time, either for specifying brand new collaborations and transactions, or for re-using existing ones.
- How to specify core transaction semantics and parameters needed for a Collaboration-Protocol Profile and Agreement (CPP/CPA).
 - Run-time transaction and collaboration semantics that the ebXML Business Process Specification Schema specifies and the Business Service Interface (BSI) is expected to manage.

5.11 How ebXML Business Process Specification Schema is used with other ebXML specifications

- 623
- 624The ebXML Business Process Specification Schema provides the structure625and semantics, as a subset of UMM semantics of Business Collaboration626definitions.
- 627A collaboration consists of a set of roles collaborating through a set of
choreographed transactions by exchanging Business Documents.
- 629As shown in Figure 5, a BPSS instance will reference, but not define, a set of630required Business Documents. Within a BPSS instance, Business Documents631are either defined by some external document specification, or assembled632directly or indirectly from lower level information structures called core633components. The assembly is based on a set of contexts, many of which are634provided by the business processes, i.e. collaborations that use the635documents in their document flows.
- The combination of the business process specification and the document
 specification become the basis against which partners can make agreements
 on conducting electronic business with each other.
- 639

601

614

615

618

619

- 641Figure 5: ebXML Business Process Specification Schema and other ebXML642Specifications
- 643
- 644The user will extract and transform the necessary information from an existing645Business Process and Information Model. Associated production rules could646aid in creating an XML representation of a BPSS instance.
- 647 Alternatively a user would use an XML based tool to produce the XML
 648 representation directly. Production rules could then aid in converting into XMI,
 649 so that it could be loaded into a UML tool, if required.
- 650In either case, the XML representation of the BPSS instance gets stored in651the ebXML repository and registered in the ebXML registry for future retrieval.652The BPSS instance would be registered using classifiers derived during its653design.
- 654 When implementers want to establish trading partner Collaboration Protocol 655 Profile and Agreement the *BPSS instance* document, or the relevant parts of 656 it, are simply referenced by the CPP and CPA XML documents. ebXML CPP 657 and CPA XML documents can reference business process specifications in 658 XML such as an ebXML BPSS instance .
- 659 Guided by the CPP and CPA specifications the resulting XML document then 660 becomes the configuration file for one or more Business Service Interfaces 661 (BSI), i.e. the software that will actually manage either partner's participation 662 in the collaboration.

5.12 How to design collaborations and transactions, re-using at design time

665

669

673

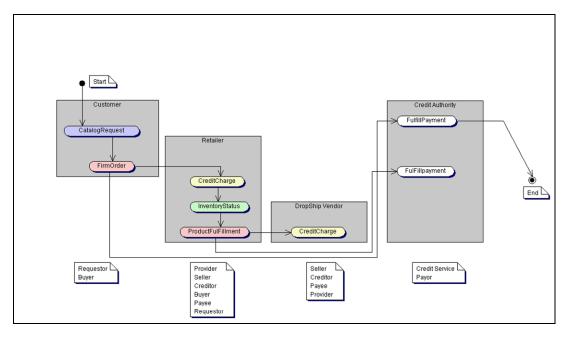

674 675

666This section describes the ebXML Business Process Specification Schema667by building a complete Multiparty Collaboration BPSS instance from the668bottom up, as follows:

- 1. Specify a Business Transaction
- 670 2. Specify the Business Document flow for a Business Transaction
- 671 3. Specify a Binary Collaboration re-using the Business Transaction
- 672 4. Specify a Choreography for the Binary Collaboration
 - Specify a higher level Binary Collaboration re-using the lower level Binary Collaboration
 - 6. Specify a Multiparty Collaboration re-using Binary Collaborations

Although this section, for purposes of introduction, discusses the specification
of collaboration from the bottom up, the ebXML *Business Process Specification Schema* is intended for specifying collaborations from the top
down, re-using existing lower level content as much as possible.

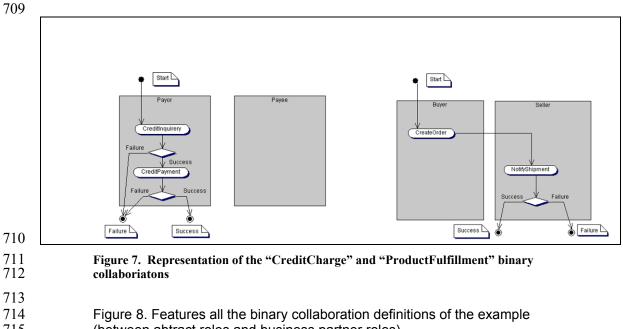

- The constructs listed above support the specification of fairly complex multi
 party collaborations. However, a BPSS instance may be as simple as a single
 Binary Collaboration referencing a single Business Transaction. This
 involves only numbers 1 through 3 above.
- Note the ebXML BPSS technical specification does not specify any Business
 Process modeling methodology nor does it require the use of such
 methodology. Should a modeling methodology be needed, it is recommended
 to use the one of the UMM specification.
- 688 We have chosen a "drop ship" example which involves a buyer, a retailer, a 689 vendor, and a credit organization. The order is placed by the buyer and 690 fulfilled by the vendor. The credit authority makes sure that payments are 691 made to appropriate creditors. We are using UML activity diagrams and use 692 case diagrams to give a picturesc representation of this multi-party 693 collaboration. This notation is non-normative and only here to help 694 understand the example. It is used in a way that do not adhere to the UML
- 695 semantics.
- 696Figure 6 represents the overall multi-party collaboration. The conventation697that we are using is such that an "activity" represents a binary collaboration698between two roles. Since we have four roles represented here, we have699adopted the following convention: the activity is placed in the swimlane of the
- 700 role that starts the binary collaboration. The responding role is the one
- directly facing the activity. This is why the swimlane have different sizes.

703Figure 6. Representation of the "DropShip" multi-party collaboration with a UML704activity diagram.

All binary collaboration in the example feature only one business transaction
 activity except two of them: Credit Charge and Product Fulfillment. These
 binary collaborations are represented on figure 7. with the same convention.

- 715 (between abtract roles and business partner roles).
- 716

	RequestCatalog Customer FirmOrder FirmOrder Retailer Retailer ProductFulfillment DropShip Vendor
	RequestCatalog Provider InventoryStatus Requestor InventoryStatus Requestor RequestCatalog Provider Provider Provider Provider Provider Provider Provider Provider Provider Provider Provider
717	CreditInquiry Creditor CreditCharge CreditCharge
718	Figure 8. Multi-party and binary collaboration definitions of the example.
719	
720	The complete XML is provided in Appendix A.
721 722 723 724 725	5.12.1 Packages and Includes All elements of this specification are defined within the context of a package. Packages may contain other package, therefore defining a hierarchy of packages.
726 727 728	A package defines the namespace of the elements inside it. You cannot have two model elements with the same name within the same package. Model element names can be qualified with the package using the Java notation:
729	org.ebxml.transaction.order.ProcessPurchaseOrder
730 731 732	Which means that the <i>ProcessPurchaseOrder</i> business transaction is defined within the package <i>order</i> , which is itself, defined within the <i>transaction</i> package.
733 734 735 736 737 738 739	If a model element in package Order Entry needs to name something in a package called Billing, it must include this package to make its elements visible to its own model elements. Unlike an import, include requires that all model elements from the Billing package be fully qualified. So if we want to designate the Invoice business document within the Order Entry.Process Purchase Order transaction we need to refer to the Billing.Invoice document, assuming it is defined in the Business Transaction.Billing package.

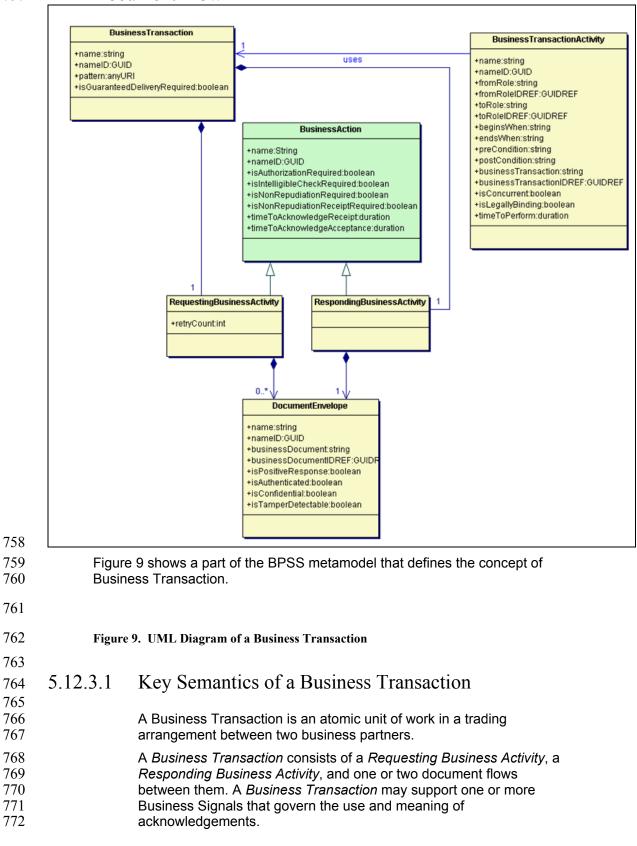

740 5.12.2 Substitution Sets

741There is a requirement for Business specifications that are less coupled to742technology and business details, such as specific document formats and743structures and timing parameters. Substitution sets support the capability to744take a generic business process and specialize it for a specific use. For745example, an ordering process may be very generic but a specific use of that746process may require specific document capabilities that go beyond the747generic.

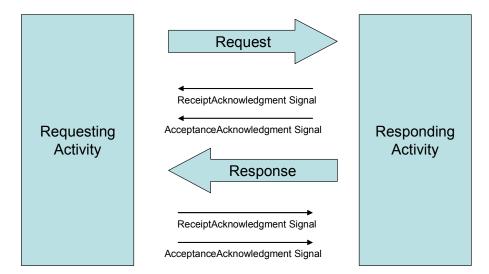

748A substitution set is placed in the more specific process specification and749replaces or makes more explicit document definition references and attribute750values. A Substitution Set is a container for one or more AttributeSubstitution751and/or DocumentSubstitution elements. The entire SubstitutionSet specifies752document or attribute values that should be used in place of some documents753and attribute values in an existing process specification.

754

5.12.3 Specify a Business Transaction and its Business Document Flow

773 774 775 776 777 778 779 780 781		Implicitly there is a requesting role performing the <i>Requesting</i> <i>Business Activity</i> and a responding role performing the <i>Responding</i> <i>Business Activity</i> . These roles become explicit when the transaction is used within a <i>Business Transaction Activity</i> within a <i>Binary</i> <i>Collaboration</i> . There is no need to make these roles more explicit such as buyer or seller. In particular some business transactions, for example "Cancel Purchase Order" may be used either way within the same binary collaboration definition as two different <i>Business</i> <i>Transaction Activities</i> .
782		There is always a Request document flow.
783 784 785 786		A Business Transaction definition specifies whether a response document is required. This type of business transactions is typically associated with the formation of contracts or agreements. A Business Transaction with a request only is typically used for notifications.
787 788 789 790		An abstract superclass, <i>Business Action</i> , is the holder of attributes that are common to both Requesting Business Activity and Responding Business Activity. This element is abstract, it is does not appear in ebXML BPSS instances.
791 792 793	5.12.3.2	Sample syntax Here is a simple business transaction definition with just a requesting and responding document flow:
794 795 796 797 798 799 800 801 802 803 804 805		<businesstransaction name="Catalog Request"> <requestingbusinessactivity <br="" name="requestCatalog"><documentenvelope businessDocument="Catalog Request"/> </documentenvelope </requestingbusinessactivity> <respondingbusinessactivity name="sendCatalog"> <documentenvelope isPositiveResponse="true" businessDocument="Catalog" /> </documentenvelope </respondingbusinessactivity> </businesstransaction>
805 806 807 808 809		Business signals acknowledging the document flow may be associated with each document flow .These acknowledgment signals are not specified explicitly however, two Business Transaction parameters specify whether the signals are required or not.
810 811		Figure 10 presents the possible Document Flows and business signals within a Business Transaction.
812		

815 816

817

818

Figure 10. Possible document flows and signals and their sequence

These acknowledgment signals (a.k.a. Business Signals) are application level documents that 'signal' the current state of the business transaction.

819 The pattern of a *Business Transaction* may be used to specify 820 whether a Receipt Acknowledgement and/or an Acceptance 821 Acknowledgement signal are required. If the pattern attribute is not used, a non null value in the timeToAcknowledgeReceipt and 822 823 timeToAcknowledgeAcceptance will mean that these signals must be 824 issued by the corresponding party. Business transaction protocol 825 signals are independent from lower protocol and transport signals such as reliable messaging. 826

827 The Receipt acknowledgement business signal, if used, signals that a 828 message (Resquest or Response) has been properly received by the 829 ebXML Business Service Interface software component. The property 830 isIntelligibleCheckRequired allows partners to agree that a 831 message should be confirmed by a Receipt acknowledgement only if 832 it is also legible. Legible means that it has passed structure/ schema validity check. The content of the receipt and the legibility of a 833 834 message (if required) are reviewed prior to the processing of the 835 Business Document or the evaluation of condition expressions in the message's business documents or document envelope. 836

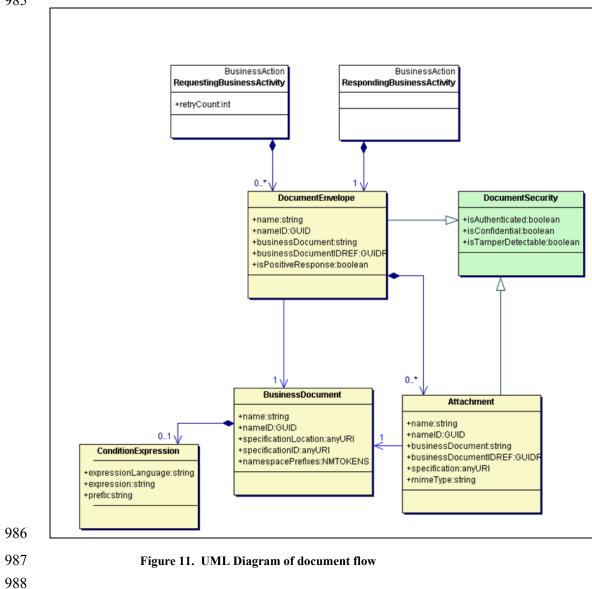

837 The Acceptance Acknowledgement business signal, if used, signals 838 that the message received (Request or Response) has been accepted for business processing by the receiving application, or a receiving 839 840 business application proxy. This is the case if the contents of the 841 message's business documents and document envelope have passed 842 a business rule validity check. These business rules are not necessarily specified as part of the collaboration. The state of each 843 party is considered to be aligned when the receiving application (in 844 general unknown to the other party) has signaled, via the BSI and an 845 846 Acceptance Acknowledgement, that the business document has been 847 successfully processed. Note that this acknowledgement is nonsubstantive, and simply indicate that the receiving party has reached a 848 849 satisfactory state. If for any reason, the application could not process

850 851 852 853 854 855 856	the business document, the sending party should be notified via a negative Acceptance Acknowledgement signal such that is can transition to a meaningful "internal" business state. For instance, a Purchase Order could not be considered in the "sent" state, unless the other party had sent the corresponding Acceptance Acknowledgment. The substantive response would come after the signal indicating whether the order had been Accepted or Rejected.
857 858 859 860 861 862 863 864	Failure to send either signal, when <i>required</i> (by specifying a timeout value in <i>timeToAcknowledgeReceipt</i> or timeToAcknowledgeAcceptance), will result in the transaction being null and void, and therefore will prevent to reach any "success" end state (protocol or business) that would have depended on receipt of a business document satisfying the associated <i>timeToPerform</i> . In order for a business transaction activity instance to reach a "success" state at run-time, the following things would need to happen:
865	 no timeout would have occurred (signals or response)
866	 no signal can have a negative content
867 868 869	 the response document sent to the requestor must be marked as isPositiveResponse = 'true' in the ebXML BPSS instance that specifies the business collaboration
870 871	Conversely, if all signals are positive and sent and received on time, the transaction will be successful from a protocol perspective.
 872 873 874 875 876 877 878 879 880 881 882 883 884 885 	The <i>isPositiveResponse</i> attribute of a <i>DocumentEnvelope</i> is not part of the business transaction protocol and therefore does not impact the protocol success or failure of a collaboration. If the DocumentEnvelope received as a response is specified with the isPositiveResponse=false (at design time) the business transaction will end in a business failure state. The choreography of the binary collaboration may use this information to execute corresponding transitions or stop the collaboration altogether. Note that this attribute is optional and some document envelope may neither be positive or negative (consider for instance the case of a partial acceptance on a purchase order, where only a few line items are refused, or a back order response). In this case, the business transaction activity is considered successful, again after it has reached a protocol success state.
 886 887 888 889 890 891 892 893 894 895 896 897 898 899 900 	The <i>isGuaranteedMessageDeliveryRequired</i> refers to the underlying messaging service used to implement the business transaction protocol. The business transaction protocol is designed to achieve state alignment between both parties involved in the transaction and signals to the sending party the successful processing of the business documents, request or response, by the receiving application, whatever it might be. However, to achieve this result, the business transaction protocol shall be implemented on top of a reliable messaging service that provides guaranteed message delivery at the transport level. If the sending party was not guaranteed that its message or in particular signal reached the intended recipient, it could never be sure that the other party state is aligned with its own state. Since a signal structure is fixed there is no ambiguity about the BSI processing it and understanding its meaning provided you know that it reached its destination, unlike a request or response which could have

901 902 903 904		an invalid structure or content. In the case where the business transaction does not need to guarantee processing by the receiving application this condition can be relaxed and regular messaging services may be used.
905 906 907 908 909 910		Note that we can only guarantee the successful synchronization of state between two parties if reliable messaging is used and if the business transaction is defined to use the request and response acceptance acknowledgement signals, which guarantee that the corresponding business documents were processed by the respective applications.
911 912 913	5.12.3.3	Sample syntax Here is a slightly more complex transaction with two document flows and three business signals.
914 915 916 917 918 919		The request requires both receipt and acceptance acknowledgement, the response requires only receipt acknowledgement. "P2D" is a W3C Schema syntax adopted from the ISO 8601 standard and means Period=2 Days. P3D means Period=3 Days, P5D means Period=5 Days. These periods are all measured from original sending of request.
920 921 922 923 924 925 926 927 928 929 930 931 932 933 934 935 936 937 938 939 940 941 942 943 944 945 944 945 946 947 948 949 950 951 952 953		<businesstransaction name="CreateOrder" nameID="122A3DD33" isGuaranteedDeliveryRequired="true"> <requestingbusinessactivity name="sendOrder" nameID="122A3E833" isNonRepudiationReceiptRequired="false" isNonRepudiationReceiptRequired="false" isNonRepudiationReceipt="PIH" <pre></pre></requestingbusinessactivity </businesstransaction
954 955		means that we are specifying a "period" of 1 day.

956 5.12.3.4 Specifying Business Document flows

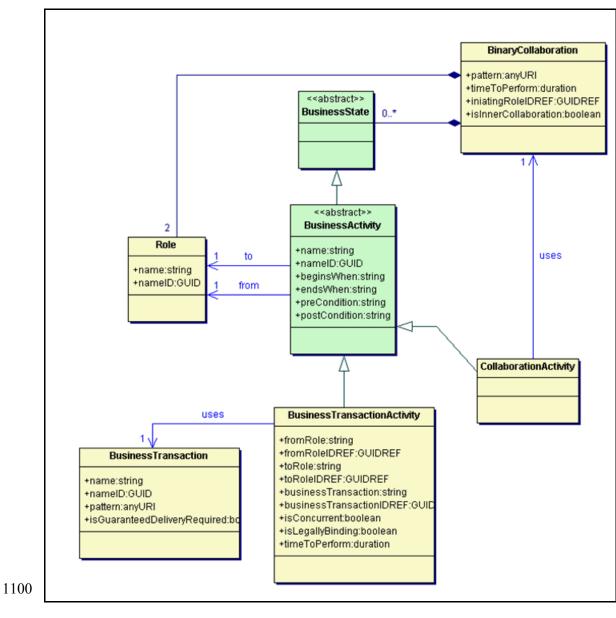

- 958Request document flows and response document flows contain959Business Documents that pertain to the Business Transaction request960and response. The model for this is shown in Figure 11. Business961Documents have varying structures. Business signals, however962always have the same structure, defined once and for all as part of the963ebXML Business Process Specification Schema technical964specification.
- 965A document flow is not modeled directly. Rather it is modeled966indirectly as a Document Envelope sent by one role and received by967the other. The Document Envelope is always associated with one968Requesting Business Activity or one Responding Business Activity to969specify the flow.
- 970Document Envelopes are named. There is always only one named971Document Envelope for a Requesting Activity. There may be zero,972one, or many mutually exclusive, named Document Envelopes for a973Responding Activity. For example, the Response Document974Envelopes for a purchase order transaction might be named975PurchaseOrderAcceptance, PurchaseOrderDenial, and
- 976 PartialPurchaseOrderAcceptance. In the actual execution of the
 977 purchase order transaction, however, only one of the defined possible
 978 responses will be sent.
- 979Each Document Envelope carries exactly one primary Business980Document.
- 981A Document Envelope can optionally have one or more attachments,982all related to the primary Business Document. The document and its983attachments in essence form one transaction in the payload in the984ebXML Message Service message structure.

5.12.3.5 Sample syntax 990 991 This example shows a business transaction with one request and two 992 possible responses, a success and a failure. The response has an 993 attachment. All the Business Documents are fully qualified with the 994 schema name. 995 996 <BusinessDocument 997 name="Credit Request" 998 nameID="122A3F613C " 999 specificationLocation="http://.../creditRequest.xsd 1000 " 1001 specificationID="http://... /creditRequest.xsd" 1002 namespacePrefixes="fix"> 1003 </BusinessDocument> 1004 1005 <!-- The following two documents refer to the same 1006 physical document, however, by their content as evaluated 1007 at run-time, they are logically different --> 1008 <BusinessDocument 1009 name="Credit Denied" 1010 nameID="122A3F8E3" 1011 specificationLocation="http://.../creditResponse.xs 1012 d″ 1013 specificationID="http://.../creditResponse.xsd" 1014 namespacePrefixes="fix"> 1015 <ConditionExpression 1016 expressionLanguage="XPATH 1.0" 1017 expression="//@CreditResponse='denied'" 1018 prefix="fix"/> 1019 </BusinessDocument> 1020 1021 <BusinessDocument 1022 name="Credit Approved" 1023 nameID="122A3F6C3" 1024 specificationLocation="http://.../creditResponse.xs 1025 d″ 1026 specificationID="http://.../creditResponse.xsd" 1027 namespacePrefixes="fix"> 1028 <ConditionExpression 1029 expressionLanguage="XPATH 1.0" 1030 expression="//@CreditResponse='approved'" 1031 prefix="fix"/> 1032 </BusinessDocument> 1033 1034 <BusinessDocument 1035 name="Credit Rating" 1036 nameID="122A3F8E4" 1037 specificationID="http://.../creditRating.id"> 1038 </BusinessDocument> 1039 1040 <BusinessTransaction 1041 name="Check Credit" 1042 nameID="122A3DD33" 1043 isGuaranteedDeliveryRequired="true"> 1044 <RequestingBusinessActivity 1045 name="checkCredit" 1046 nameID="122A3E833"

1098 5.12.4 Specify a Binary Collaboration
 1099 Figure 12 shows part of the metamodel of a binary collaboration.

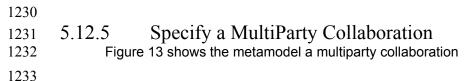

```
1101
```

Figure 12. UML Diagram of a Binary Collaboration

1103 1104 1105 1106 1107 1108 1109 1110 1111 1112	5.12.4.1	Key Semantics of a Binary Collaboration A Binary Collaboration is always defined between two roles. One of the roles is initiating the collaboration. This is the role, which sends the first message (i.e. Request) of the first Business Transaction Activity. This attribute is used to "bind" the roles of an inner Collaboration Activity to the parent Binary Collaboration roles. Even if this role is not know until run-time, we can still specify a "logical" initiating role. In that case, the initiating role of the parent binary collaboration definition will be bound to the initiating role of the inner binary collaboration definition.
1113 1114 1115 1116		It is critical that the <i>Role nameID</i> be unique with respect to a <i>Binary Collaboration</i> definition even if role names are identical for two <i>Binary Collaboration</i> definitions. This means that two binary collaboration may never have the same physical role, but share a "logical" role.
1117 1118 1119 1120 1121 1122		A <i>Binary Collaboration</i> consists of one or more Business Activities. These Business Activities are always conducted between the two Roles of the Binary Collaboration. For each activity one of two roles is assigned to be the <i>initiatingRole</i> (from) and the other to be the <i>respondingRole</i> (to). This is irrespective who initiated the binary collaboration.
1123 1124		A Business Activity can be either a Business Transaction Activity or a Collaboration Activity.
1125 1126 1127 1128 1129 1130 1131 1132 1133 1134 1135 1136		A Business Transaction Activity is the performance of a Business Transaction. Business Transaction definitions can be associated to any number of Business Transaction Activity elements. This means that the same Business Transaction can be performed by multiple Business Transaction Activities in different Binary Collaborations, or by multiple Business Transaction Activities in the same Binary Collaboration, sometimes with opposite roles. For instance a "Cancel Purchase Order" Business Transaction could be used by two Business Transaction Activities, which can be performed by either party, meaning that after a purchase order has been accepted, either party could cancel it (for a certain period of time) using the same business document interchange.
$\begin{array}{c} 1137\\ 1138\\ 1139\\ 1140\\ 1141\\ 1142\\ 1143\\ 1144\\ 1145\\ 1146\\ 1147\\ 1148\\ 1149\\ 1150\\ 1151\\ \end{array}$		A Collaboration Activity is the performance of a Binary Collaboration, within another Binary Collaboration. Binary Collaboration definitions are re-useable relative to Collaboration Activity. The same Binary Collaboration can be performed by multiple Collaboration Activities in different Binary Collaborations, or by multiple Collaboration Activities in the same Binary Collaboration. A binary collaboration definition may be restricted to be an "inner collaboration" only via the the boolean attribute isInnerCollaboration. In this case, the binary collaboration definition can only be initiated as part of a Collaboration Activity and cannot be initiated by itself. Business Transaction Activity and Collaboration Activity may define business rules with the beginsWhen, endsWhen, preCondition and postCondition attributes. These attributes do not have a specific syntax as part of this specification, so the current type is string. Because these expressions cannot be generally executed by an
1152		ebXML infrastructure, in the current release of the ebXML BPSS

- 1153 technical specification, they are considered to have a "documentation" 1154 purpose. In particular they cannot be used to specify any part of the 1155 choreography of the collaboration. In future releases they will play a 1156 role along with transitions and pseudo-states. The semantics of 1157 beginsWhen and endsWhen indicate that the corresponding business activity needs to be started or ended as soon as the expression in the 1158 1159 attribute value is true. PreConditions and postConditions indicate that 1160 the corresponding business activity may start only if the corresponding expressions are true. 1161
- 1162 When performing a Binary Collaboration within a Binary Collaboration there is an implicit relationship between the roles at the two levels. 1163 1164 Assume that Binary Collaboration X is performing Binary Collaboration Y through Collaboration Activity Q. Binary Collaboration X has the 1165 following roles: Customer and Vendor. In Collaboration Activity Q we 1166 1167 assign Customer to be the initiator, and Vendor to be the responder. 1168 Binary Collaboration Y has the following roles: Buyer and Seller and a Business Transaction Activity where Buyer is the initiator and Seller 1169 1170 the responder. We have now established a role relationship between 1171 the roles Customer and Buyer because they are both initiators in 1172 activities in the related performing and performed Binary 1173 Collaborations.
- 1174Since a Business Transaction is atomic in nature, the performing of a1175single Business Transaction through a Business Transaction Activity1176is also atomic in nature. If the desired semantic is not atomic, and1177then the task should be split over multiple transactions. For instance if1178it is desired to specify several partial acceptances of a request, then1179the request should be specified as one transaction within a binary1180collaboration and the partial acceptance(s) as separate transactions.
- 1181The CPA/CPP Specification allows that parties agree upon a1182Collaboration Protocol Agreement (CPA) in order to transact business.1183A CPA may associate itself with a specific *Binary Collaboration*. Thus,1184all *Business Transactions* performed between two parties should be1185referenced through *Business Transaction Activities* contained within a1186*Binary Collaboration*.

1315 5.12.6 Specify a Choreography

1316 Figure 14 shows the metamodel of a choreography.

1341	concrete Business States. The business collaboration can be said to
1342	be in the state of performing a given business activity. Once a
1343	business activity complete a transition from this business activity is
1344	navigated to another business activity or pseudo-state. A message
1345	shall either initiate a collaboration or advance its state.
1346	There are a number of auxiliary kinds of Business States that facilitate
1347	the choreographing of Business Activities. These include a Start state,
1348	a Completion state (which comes in a Success and Failure flavor), a
1349	Fork state, a Join state and a Decision state. These are all equivalent
1350	to diagramming artifacts on a UML activity diagram, however, the
1351	semantics are not exactly the same. An XOR value in the type
1352	attribute of a fork means that only one Business State of the fork will
1353	be allowed to be reached. All the other will become invalid as soon as
1354	one of the business state is reached (e.g. a Business Transaction
1355	Activity starts). An OR value will mean that any business activity
1356	pointed to by a transition coming from the fork might be initiated.
1357	These business activities may occur in parallel. Note that it is not
1358	important to specify the order in which condition expression on a
1359	transition coming from a fork will be evaluated. It is merely the order in
1360	which the request of the business transaction activities will arrive that
1361	will determine the order in which the condition expression need to be
1362	evaluated. A fork has a timeToPerform attribute. At the end of this
1363	time interval, the state of the Binary Collaboration will automatically be
1364	moved to its corresponding join. This feature is useful in cases where
1365	the business activities are optional. For instance a Cancel Purchase
1366	Order and Change Purchase Order business transaction activity could
1367	be defined as part of a Fork/Join control block. However, most often
1368	none of these activity would happen. If any given Business
1369	Transaction Activity within the Fork/Join pair is has not reached its
1370	completion state, the BSI will generate a corresponding timeout
1371	exception. As a well formed rule, the timeToPerform of a fork can not
1372	be less that any timeToPerform of its business activities. The
1373	waitForAll attribute of the join will indicate that all transitions coming
1374	into the join shall be executed in order for the collaboration to reach
1375	the join pseudo-state (AND-join), by default, the join is an AND-join.
1376	When this parameter is set to false, it is an OR-join. The BSI will
1377	generate a timeout exception if an OR-join is reached while a
1378	Business Activity has not reached its completion state. The semantics
1379	of fork and join are such that for instance a fork may be defined
1380	without a corresponding join. In this case, the timeToPerform attribute
1381	shall not be used. It must only be used in the case where all outgoing
1382	transitions from the fork have incoming transitions to the join.
1202	

Fork	Join	Comments
OR	WaitforAll (true)	This models the behavior of an AND-fork and AND-Join
OR	WaitforAll (false)	If timeout is null, should rather use XOR as the join will happen on the first transition reaching the join state
XOR	WaitforAll (true)	This combination is forbidden (would lead to a dead lock)

XOR	WaitforAll (false)	Only one path between the fork and join will be allowed to happen
timeToPerform >0	Any value	The join happens when timeToPerform is reached.

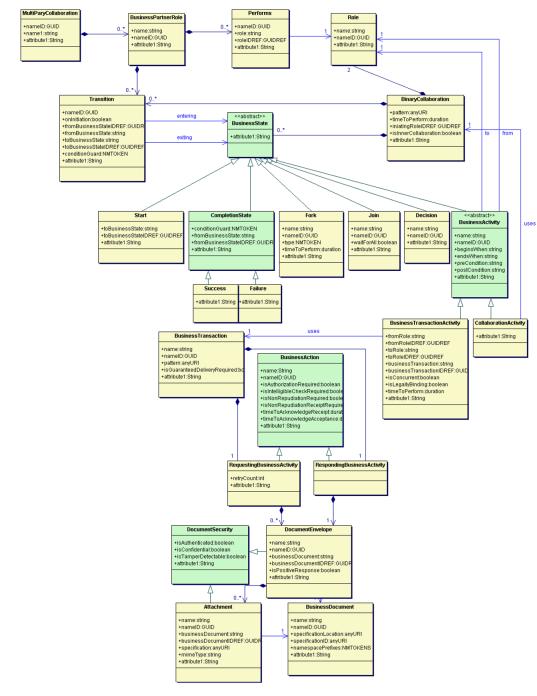

1385 Transitions can originate from Business Transaction Activities or 1386 Collaboration Activities within a Binary Collaboration, or from Binary 1387 Collaborations within a Multiparty Collaboration. Guards can gate 1388 transitions. Guards refer to the status of the Business Transaction 1389 Activity from which the transition originates. The guard values include: 1390 ProtocolSuccess, AnyProtocolFailure, RequestReceiptFailure, 1391 RequestAcceptanceFailure, ResponseReceiptFailure, 1392 ResponseAcceptanceFailure, SignalTimeOut, ResponseTimeOut, 1393 Failure, BusinessSuccess, BusinessFailure and Success. Transitions 1394 may also have a condition expression element. A 1395 ConditionExpression element has a language attribute, which 1396 specifies in which language the predicate is written. We do not limit 1397 the type and number of languages a BSI may support. However, for 1398 compliance, a BSI is required to support at least the XPath language, 1399 as well as the DocumentEnvelopeNotation. An XPath expression may 1400 involve the content of any DocumentEnvelope received prior to the 1401 transition within the scope of the current binary collaboration instance. 1402 The DocumentEnvelopeNotation is simply defined as the name or ID 1403 of a document envelope. 1404 The Success and Failure elements represent an aggregation of a 1405 state and a transition to this particular state. This transition like regular 1406 transitions can be guarded by a conditionGuard. The conditionGuard 1407 can be used to indicate that a binary collaboration ends in success or 1408 failure based on the fact that the last business transaction activity 1409 response is a business document of a particular type, or based on the 1410 content of the response. It is important to note that the success or 1411 failure of the collaboration does not affect the success or failure of the 1412 individual business transaction activities, which compose the binary 1413 collaboration. In particular, the nature of the commitments is not 1414 changed when the collaboration ends in a specific state. The success 1415 or failure of a collaboration is rather an indication, which can be 1416 reported on, or acted upon to initiate other collaborations. If several 1417 completion states are specified within a collaboration definition, the 1418 business collaboration run-time instance state is "complete" as soon 1419 as one of the completion state is reached. It is the responsibility of the 1420 designer to ensure that all completion states are mutually exclusive 1421 and that once one of them is reached there are no further Business 1422 Activity open. A timeout exception will be generated by the BSI in 1423 such a case. 1424 A Transition can also be used to create nested BusinessTransaction-1425 Activities. A nested BusinessTransactionActivity is enabled when a 1426

1426transition flows from a parent BTA to the nested BTA and this1427transition is marked onInitiation = 'true'. In this case, the transition is1428enabled after the receipt of the request in the parent transaction but1429after the request has been acknowledged appropriately if applicable.1430At this point, the second activity is performed before returning sending1431the response to the original requestor. No "return" transition is

1432 1433 1434 1435 1436 1437 1438 1439 1440 1441		specified. If more than one transaction ought to be executed they must be specified within a collaboration activity. There are no possible outgoing transitions fom a nested activity unless it is associated to an exception. If the activity terminates normally, the thread of control is handed back to the parent activity. The flag 'onInitiation' in Transition is used for this purpose. Nested <i>Business Transaction Activity</i> are often found within a multiparty collaboration. In essence a Role in one Binary Collaboration receives a request, then turns around and becomes the requestor in other Binary Collaboration before coming back and sending the response in the first Binary Collaboration.
1442 1443 1444 1445 1446 1447 1448 1449 1450		<i>isConcurrent</i> is a parameter that governs the flow of transactions. Unlike the security and timing parameters it does not govern the internal flow of a transaction, rather it determines whether at run-time multiple instances of that business transaction activity can be 'open' at the same time within any collaboration instance perfomed between any two partners. As a result, when <i>isConcurrent</i> is set to false, the BSIs of each party are responsible for serializing these business transaction activities.
1451	5.12.6.2	Sample syntax
1451 1452 1453 1454 1455 1456	5.12.0.2	Here is the same Binary Collaboration as used before, with choreography added at the end. There is a transition between the two, a start and two possible outcomes of this collaboration, success and failure:
1457 1458 1459 1460 1461 1462 1463 1464 1465 1466 1467 1468		<binarycollaboration name="Product Fullfillment" nameID="122A38D93" Role="233A38DA3" timeToPerform="P3D"> <role name="buyer" nameID="122A38DA3"/> <role name="seller" nameID="122A38DA5"/> <start< td=""></start<></role </role </binarycollaboration
1469 1470 1471 1472 1473 1474 1475 1476 1477 1478 1479 1480 1481 1482 1483 1484		<pre>toBusinessState="Create Order" toBusinessStateIDREF="122A39C23"/> <businesstransactionactivity name="Create Order" nameID="122A39C23" businessTransaction="Create Order" businessTransactionIDREF="122A39C24" fromRole="buyer" fromRoleIDREF="122A38DA3" toRole="dealer" toRoleIDREF="122A38DA5" isConcurrent="true" isLegallyBinding="false" timeToPerform="P1H"/> <businesstransactionactivity name="Notify Shipment" nameID="122A39CA3"</businesstransactionactivity </businesstransactionactivity </pre>

1599 5.12.7 The whole model

1600

 Figure 15. Overall UML Model of the ebXML Business Process Specification Schema
 Figure 15 represents the complete metamodel of ebXML BPSS as a UML class diagram..

1607 **5.13 Core Business Transaction Semantics**

- 1608The ebXML concept of a business transaction and the semantics behind it1609are central to predictable, enforceable commerce. It is expected that any1610Business Service Interface (BSI) will be capable of managing a transaction1611according to these semantics.
- 1612The ebXML Business Transaction semantics, i.e. the rules and configuration1613parameters required for Business Service Interface software to predictably1614and deterministically execute ebXML Business Transactions, allows you to1615specify electronic commerce transactions that provide
- Interaction Predictability, i.e. have clear roles, clear transaction scope, clear time bounds, clear business information semantics, clear determination of success or failure. Each party can compute without ambiguity and the status of a transaction independently.
 Ability to create Legally Binding Contracts, i.e. the ability to specify
 - Ability to create Legally Binding Contracts, i.e. the ability to specify that Business Transactions may be agreed to bind the parties. This concept is being deprecated as of this version.
- Nonrepudiation, i.e. may specify the keeping of artifacts to aid in legal enforceability.
 - Authorization Security, i.e. may be specified to require authorization of parties performing roles.
 - Document Security, i.e. may be specified to be authorized, authenticated, confidential, tamper detectable.
 - Reliability, i.e. the ability to specify reliable delivery of Business Documents and signals.
- 1631Each of the above characteristics of the concept that we call an ebXML1632Business Transaction semantics is discussed in detail below.
- 1633 These desirable characteristics are only applicable to ebXML Business 1634 Transactions, where an ebXML Business Transaction is a single request or 1635 single request / response pair only. A future version of this specification may 1636 extend the applicability of these characteristics to other types of electronic 1637 commerce transactions. In particular, we do not claim that the ebXML 1638 Business Transaction concept covers all possible electronic commerce 1639 transactions. For instance, a use case could involve an electronic commerce 1640 transaction that exchanges a request and two responses as a unit of work. If 1641 we would want to have similar properties, this kind of use cases would not be 1642 directly covered by this specification. The only way to handle such a use case would be to specify the electronic commerce transaction as a binary 1643 1644 collaboration involving as many ebXML Business Transaction as necessary. 1645 The binary collaboration definition would then be specified in such a way to 1646 handle the individual ebXML Business Transaction exceptions and aggregate them into the electronic commerce transaction. 1647

1629

1630

1649 5.13.1 Interaction Predictability

- 1650
- 1651All Business Transactions follow a very precisely prescribed flow, or a1652precisely defined subset there-of. The following is an overall illustration of this1653flow. It can be thought of as the state machine across the two business1654partners.

1655	
1656	The goal of the Business Transaction Protocol is to synchronize the business
1657	state between two parties. As few resources can be shared between

- 1658 company boundaries, we must use such protocol to achieve the business
- 1659 state synchronization as recorded by each party enterprise systems.

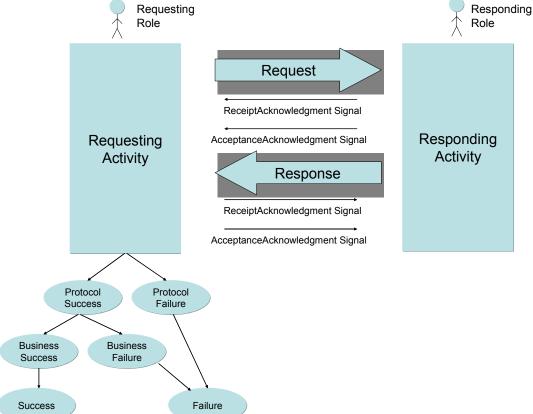

Figure 16: Schematic of core Business Transaction semantics.

1662

- Figure 16 does not assume any hierarchy in the way exceptions are generated or evaluated. It simply state that in oder to achieve a success state
- 1665a business transaction activity complete with both a procotol and a business1666success. These exception are constantly evaluated by the BSI, and thrown as1667soon as detected.
- 1668If either a protocol or business failure occurs, the business transaction activity1669will be put into a failure state.
- 1670

1673

1674

1675

1671In the ebXML model the business transaction always has the following1672semantics.

- The Business Transaction is an atomic unit of work. All of the interactions in a business transaction must succeed or each party must not change their state.
- 1676
 1677
 1678
 A Business Transaction is conducted between two business partners playing opposite roles in the transaction. These roles are always the Requesting Role and the Responding Role.

1679 1680 1681 1682 1683 1684	3.	A Business Transaction definition specifies exactly when the Requesting Activity is in control, when the Responding Activity is in control, and when control transitions from one to the other. In all Business Transactions control starts at the Requesting Activity, then transitions to the Responding Activity, and then returns to the Requesting Activity.
1685 1686	4.	A Business Transaction always starts with a request sent out by the requesting activity.
1687	5.	The request serves to transition control to the responding role.
1688 1689 1690	6.	After the receipt of the Request document flow, the responding activity may send a receiptAcknowledgement signal and/or an acceptanceAcknowledgement signal to the requesting role.
1691 1692	7.	The responding role then enters a responding activity. During or upon completion of the responding activity zero or one response is sent.
1693 1694 1695 1696 1697 1698 1699 1700	8.	Control will be returned back to the requesting activity if either a receiptAcknowledgement and/or acceptanceAcknowledgement and/or a response is specified as required. A receiptAcknowledgement (if required) must always occur before an acceptanceAcknowledgement (if required), and an acceptanceAcknowledgement must always occur before a response (if required). Control is returned to the requesting activity based on the last required of these three (if any). If none required, control stays with the responding activity.
1701 1702	9.	All business transactions succeed or fail. Success or failure depends on:
1703 1704		 The successful transmission of the request, the response and/or receipt and acceptance signals
1705		b. The occurrence of time-outs
1706 1707		 The occurrence of exceptions, as indicated by a negative receipt or acceptance signals
1708 1709 1710		 The computation of business failure or success by detecting if the response document was specified – at design time – with isPositiveResponse=false.
1711 1712 1713 1714 1715 1716 1717 1718	10.	Both parties can compute the success or failure of the transaction if reliable messaging, as well as request and response acceptance acknowledgement signals, are used. Once success or failure is thus established, the Business Transaction is considered closed with respect to both parties. If reliable messaging is not used, we cannot guarantee state alignment and therefore it could happen that one party believe the transaction has been successful, while the other believes it ended in failure.
1719 1720 1721 1722 1723	11.	Upon receipt of a response the requesting activity may send a receiptAcknowledgement and/or acceptanceAcknowledgement signal back to the responding role. This operation does not pass control back to the responding activity. If the requesting party send the signals after the timeout has occurred, the transaction is considered null and void.
1724 1725 1726	12.	Upon identifying a time-out or exception in the processing of a Business Transaction each party will close the transaction and end in a protocol failure state.

17271728 5.13.1.1 Transaction Interaction Patterns

- The business transaction specification will specify whether a requesting
 document requires a responding substantive document in order to achieve a
 "success" end state. In addition, the transaction may specify a proper
 nonzero time duration for timeToPerform, imposing a deadline for the
 substantive response.
- Furthermore, the specification of a business transaction may indicate, for the request whether receiptAcknowledgement and/or
- 1737acceptanceAcknowledgement are required, and for the response whether1738receiptAcknowledgement and/or acceptanceAcknowledgement are required.
- 1739The way to specify that a receiptAcknowledgement is required is to set the
parameter timeToAcknowledgeReceipt to any proper time duration other than
- 1741 zero. If this parameter has been set to a proper nonzero time duration,
- 1742 optionally either or both of the isIntelligibleCheckRequired and
- 1743 isNonrepudiationOfReceiptRequired parameters may also be set to 'Yes'.
- 1744The way to specify that a acceptanceAcknowledgement is required is to set1745the parameter timeToAcknowledgeAcceptance to any proper time duration1746other than zero.
- 1747So these two acknowledgement related parameters double as Boolean flags1748for whether the signal is required as part of the transaction, and as values for1749time-out of the transaction if the signal is not received.
- 1750The specification of a business transaction may require each one of these1751signals independently of whether the other is required. Therefore there is a1752finite set of combinations. The UMM supplies the currently defined set of1753transaction patterns.
- 1754

1756

1755 5.13.2 Creating legally binding contracts

- 1757 Trading partners may wish to indicate that a Business Transaction performed 1758 as part of an ebXML arrangement is, or is not, intended to be binding. A 1759 declaration of intent to be bound is a key element in establishing the legal 1760 equivalence of an electronic message to an enforceable signed physical writing. Parties may create explicit evidence of that intent by (1) adopting the 1761 1762 ebXML Business Process Specification Schema standard and (2) 1763 manipulating the parameter ("isLegallyBinding") designated by the standard 1764 to indicate that intent.
- 1765In some early electronic applications, trading partners have simply used the1766presence, or absence, of an electronic signature (such as under the XML-1767DSIG standard) to indicate that intent. However, documents which rely solely1768on the presence of a signature may or may not be correctly interpreted, if1769there is semantic content indicating that a so-called contract is a draft, or1770nonbinding, or the like.
- 1771 In ebXML, the presence or absence of an electronic signature cannot indicate 1772 by itself legally binding assent, because XML-DSIG signatures are reserved 1773 for other uses as an assurance of sender identity and message integrity.
 - for other uses as an assurance of sender identity and message integrity.

- isLegallyBinding is a parameter at the BusinessTransactionActivity level,
 which means that the performing of a BusinessTransaction within a Binary
 Collaboration is either specified as legally binding or not.
- 1777 When operating under this standard, parties form binding agreements by 1778 exchanging binding messages that agree to terms (e.g., offer and 1779 acceptance). The "isLegallyBinding" parameter is Boolean, and its default 1780 value is "true." Under this standard, the exclusive manner for indicating that 1781 a Business Activity is not intended to be binding is to include a "false" value 1782 for the "isLegallyBinding" parameter for the transaction activity. As in EDI, 1783 the ebXML standard assumes that Business Transactions are intended by the 1784 trading parties to be binding unless otherwise indicated.
- 1785 As a non-normative matter, parties may wish to conduct nonbinding 1786 transactions for a variety of reasons, including testing, and the exchange of 1787 proposed offers and counteroffers on a non-committal basis so as to discover 1788 a possible agreed set of terms. When using tangible signed documents, 1789 parties often do so by withholding a manual signature, or using a "DRAFT" 1790 stamp. In ebXML, trading partners may indicate that result by use of the 1791 "isLegallyBinding" parameter. See the illustrative Simple Negotiation Pattern 1792 set forth in the ebXML E-Commerce Patterns.

1793 5.13.3 Non-Repudiation

- 1794Trading partners may wish to conduct legally enforceable business1795transactions over ebXML. A party may elect to use non-repudiation protocols1796in order to generate documentation that would assist in the enforcement of1797the contractual obligation in court, in the case that the counterparty later1798attempts to repudiate its ebXML Business Documents and messages.
- 1799Repudiation generally refers to the ability of a trading partner to argue at a1800later time, based on the persistent artifacts of a transaction, that it did not1801agree to the transaction. That argument might be based on assertions that a1802replying document was not sent, or was not sent by the proper party, or was1803incorrectly interpreted (under the applicable standard or the trading partners'1804business rules) as forming agreement.
- 1805 There are two kinds of non-repudiation protocol available under this 1806 document. Each protocol provides the user with some degree of additional 1807 evidentiary assurance by creating or requesting additional artifacts that would assist in a later dispute over repudiation issues. Neither is a dispositive 1808 1809 absolute assurance. As in the paper world, trading partners are always free 1810 to invent colorful new arguments that an apparently-enforceable statement 1811 should be ignored. These parameters simply offer some opportunities to 1812 make that more difficult.
- 1813 One imposes a duty on each party to save copies of all Business Documents 1814 and Document Envelopes comprising the transaction in the form they where 1815 received(e.g. save in encrypted form if they where received in encrypted 1816 form), each on their own side, i.e., requestor saves his request, responder 1817 saves his response. This is the isNonRepudiationRequired parameter in the 1818 requesting or responding activity. It is logically equivalent to a request that 1819 the other trading partner maintain an audit trail. However, failure to comply 1820 with that request is not necessarily computationally detectable at run time, nor 1821 would it override the determination of a "success" or "failure" end state. This 1822 relates to the business action concept in the UMM.
- 1823The other requires the receiver of a business document to send a signed1824receipt, which the original sender saves. This is the

- 1825 isNonRepudiationOfReceiptRequired parameter in the requesting and1826 responding business activity.
- 1827 NonRepudiationOfReceipt is tied to the ReceiptAcknowledgement, in that it 1828 requires the latter to be digitally signed. So NonRepudiationOfReceipt is 1829 meaningless if ReceiptAcknowledgement is not required. Failure to comply 1830 with NonRepudiation of Receipt would be computationally detectable at run 1831 time, and would override the determination of a "failure" end state. If a 1832 timeToAcknowledgeReceipt is imposed on a requesting message, and 1833 NonRepudiationOfReceipt is true, only a digitally signed receipt will satisfy the 1834 imposed timeout deadline. Thus, a failure to send a signed receipt within 1835 timeToAcknowledgeReceipt, would make the transaction null and void.

1836 5.13.4 Authorization security

- Each request or response may be sent by a variety of individuals,
 representatives or automated systems associated with a business partner.
 There may be cases where trading partners have more than one ebXMLcapable business service interface, representing different levels of authority.
 In such a case, the parties may establish rules regarding which interfaces or
- 1842authors may be confidently relied upon as speaking for the enterprise.1843In order to invoke those rules, a party may specify *isAuthorizationRequired* on
- 1843In order to invoke those rules, a party may specify *ISAuthorizationRequired* on1844a requesting and/or a responding activity accordingly, with the result that [the1845activity] will only be processed as valid if the party interpreting it successfully1846matches the stated identity of the activity's [Role] to a list of allowed values1847previously supplied by that party.
- 1848isAuthorizationRequired is specified on the requesting and responding activity1849accordingly.
- 1850This concept is deprecated is as of this version. Its specification might change1851in a future release and is not required for an ebXML BPSS 1.1 compliant BSI1852infrastructure. In this version, a BSI would have no way to specify that an1853attempt has been made by an application or system to initiate a Business1854Transaction (therefore sending a request) and this application or system was1855not authorized to do so.

1856

1857 5.13.5 Document security

- 1858The value of isConfidential, isTamperDetectable, isAuthenticated at the1859Document Envelope always applies to the primary Business Document. It1860also applies to each of the attachments unless specifically overridden at the1861Attachment level. These parameters can have four possible values: none,1862transient, persistent, transient-and-persistent.
- 1863Transient authentication is provided by the communications channel used to1864transport the *Message*. The specific method will be determined by the1865communications protocol used.
- 1866Persistent authentication means the Business Document signer's identity1867shall be verified at the receiving application level.
- 1868Transient confidentiality is provided by a secure network protocol, such as1869SSL as the document is transferred between two adjacent MSH nodes.
- 1870 Persistent confidentiality is intended to preserve the confidentiality of the
- 1871 message such that only the intended party (application) can see it. The
- 1872 message shall remain in encrypted form after it is delivered to the MSH node

- 1873and will be decrypted only by the authorized application. S/MIME can be used1874to provide that functionality, independent of the transient confidentiality.
- 1875Transient *isTamperDetectable* is the ability to detect if the information has1876been tampered with during transfer between two adjacent MSH nodes.
- 1877Persistent isTamperDetectable is the ability to detect if the information has1878been tampered with after it has been received by MSH, between the MSH
- 1879 and the application.
- 1880

1881 5.13.6 Reliability

- 1882This parameter isGuaranteedDeliveryRequired at the Business Transaction1883level states whether guaranteed delivery of the transaction's Business1884Documents is required.
- 1885This is a declaration that trading partners must employ only a delivery1886channel that provides a delivery guarantee, to send Business Documents in1887the relevant transaction.
- 1888

1890

1889 5.13.7 Parameters required for CPP/CPA

- 1891The ebXML Business Process Specification Schema provides parameters1892that can be used to specify certain levels of security and reliability. The1893ebXML Business Process Specification Schema provides these parameters1894in general business terms.
- 1895These parameters are generic requirements for the business process, but for1896ebXML implementations, these parameters are specifically used to instruct1897the CPP and CPA to require BSI and/or delivery channel capabilities to1898achieve the specified service levels.
- 1899 The CPP and CPA translate these into parameters of two kinds.
- 1900 One kind of parameters determines the selection of certain security and
- 1901 reliability parameters applicable to the transport method and techniques used
- 1902 by the delivery channel. Document security, and Reliability above, are
- 1903 determinators of delivery channel selection.
- 1904 The other kind of parameters determines the selection of certain service
- 1905 levels or capabilities of the BSI itself, in order for it to support the run time1906 Business Transaction semantics as listed below.

1907 **5.14***Run time Business Transaction semantics*

- 1908The ebXML concept of a business transaction and the semantics behind it1909are central to predictable, enforceable commerce. It is expected that any1910Business Service Interface (BSI) will be capable of managing a transaction1911according to these semantics.
- 1912 Therefore, the Business Service Interface (BSI), or any software that 1913 implements one role in an ebXML collaboration needs at minimum to be able
- 1915 to support the following transaction semantics:
- 1915 1. Detection of the opening of a transaction
- 19162. Detection of transfer of control
- 19173. Detection of successful completion of a transaction

1918 1919	 Application of business rules expressed as schema definitions and <i>isPositiveResponse</i> for determination of success 					
1920	4. Detection of failed completion of a transaction					
1921	a. Detection of time-outs					
1922	b. Detection of protocol exceptions					
1923 1924	 c. Validation of the received response and identify if it was specified with isPositiveResponse = false 					
1925 1926 1927 1928 1929	ebXML does not specify how these transaction semantics are implemented but it is assumed that any Business Service Interface (BSI) will be able to support these basic transaction semantics at runtime. If either party cannot provide full support, then the requirements may be relaxed as overrides in the CPP/CPA.					
1930 1931 1932 1933 1934 1935 1936 1937 1938 1939	The following sections discuss the two causes of failure: timeouts and exception. When either one happens, it is the responsibility of the two roles to exit the transaction. It is also expected that the corresponding collaboration will be designed (and choreographed) to execute the appropriate compensating transactions if needed and may reach a completion state after that. The responsibilities of the two roles differ slightly and are described in each of the sections below. Generally, if a failure other than a timeout happens at either the responding or requesting role, they will send an exception signal to the other role, and both parties will exit the current transaction.					
1940						

1941 5.14.1 Timeouts

1942

1.1 1111000

1943Since all business transactions must have a distinct time boundary, there are1944timeout parameters associated with the response and each of the1945acknowledgement signals. If the timeout occurs before the corresponding1946response or signal arrives, the transaction is null and void.

- 1947 Here are the timeout parameters relative to the three response types:
- 1948

Response required	Parameter Name and meaning of the timeout			
Receipt Acknowledgement	timeToAcknowledgeReceipt			
	The time a responding or requesting role has to acknowledge receipt of a business document.			
Acceptance Acknowledgement (Non-substantive)	timeToAcknowledgeAcceptance			
	The time a responding or requesting role has to non-substantively acknowledge business acceptance of a business document.			

Substantive Response	timeToPerform				
	The maximum amount of time between the time at which the resquest is sent and the substantive response is sent.				

1950 1951	Note that the Acceptance Acknowledgement signal is often called the "non- substantive" response to the request.
1952 1953 1954	A timeout parameter must be specified whenever a requesting or responding partner expects signals in return to the business document request or response. A requesting partner must not remain in an infinite wait state.
1955 1956 1957 1958	The timeout value for each of the timeout parameters is absolute i.e. not relative to each other. All timers start when the initial requesting business document is sent. The timer values must comply with the well-formedness rules for timer values.
1959 1960 1961	A BSI needs to comply with the above parameters to detect the appropriate timeouts. To preserve the atomic semantics of the Business Transaction, the requesting and responding roles take different action based on timeouts.
1962 1963	A responding partner simply terminates if a timeout is thrown. This prevents responding business transactions from hanging indefinitely.
1964 1965 1966 1967	The total time allowed for a business transaction activity to complete is therefore, timeToPerform plus the timeToAcknowledgeReceipt on the response, and the timeToAcknowledgeAcceptance on the response. Additionaly, timeToPerform must be greated than the sum of

1968timeAcknowledgeReceipt and timeToAcknowledge Acceptance and the1969request.

1970

1972

1971 5.14.2 Protocol Exceptions

1973In addition to timeouts, the Business Transaction protocol provides a series of1974protocol exception which indicate whether the business processing of the1975transaction went wrong at either the responding or the requesting role.

1976

1977 5.14.2.1 Receipt Acknowledgement Exception

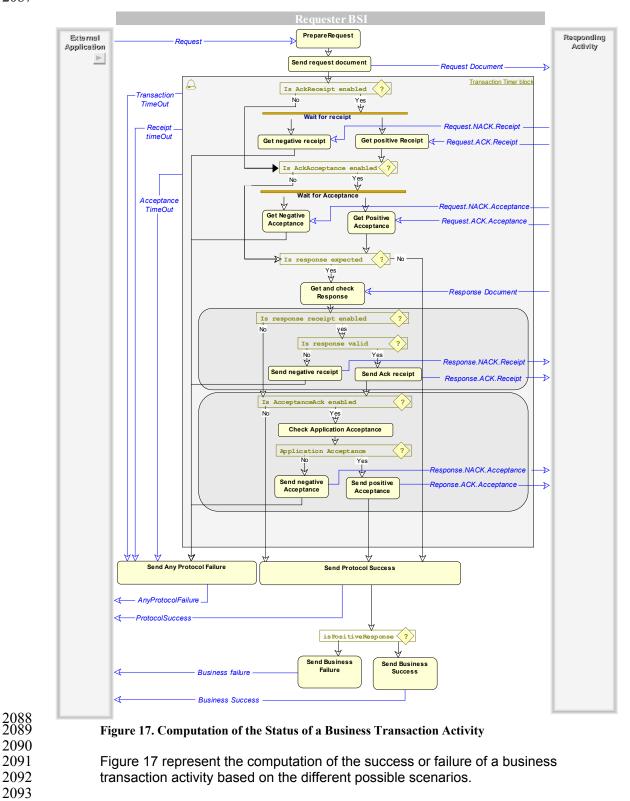

- 1978
- 1979A Receipt Exception signals an error condition in the management of a1980business transaction. This business signal is returned to the initiating activity1981that originated the request. This exception must terminate the business1982transaction. These errors deal with the mechanisms of message exchange1983such as verification, validation, authentication and authorization and will occur1984up to message acceptance. Typically the rules and constraints applied to the1985message will have only dealt with the well-formness of the message.
- 1986A receipt exception terminates the business transaction. The following are1987receipt exceptions:

1988	 Syntax exceptions. There is invalid punctuation, vocabulary or
1989	grammar in the business document or business signal.
1990	 Authorization exceptions. Roles are not authorized to
1991	participate in the business transaction activity. Note that this
1992	exception can only be identified by the receiving BSI.
1993	 Signature exceptions. Business documents are not signed for
1994	non-repudiation when required.
1995	 Sequence exceptions. The order or type of a business
1996	document or business signal is incorrect.
1997 1998	A receipt exception typically means that the current message could not be handed to an application for processing.
1999 2000	5.14.2.2 Acceptance Acknowledgement Exceptions
2001	An Acceptance Exception signals an error condition in a business activity.
2002	This business signal is returned to the initiating role that originated the
2003	request. This exception must terminate the <i>business transaction</i> . These
2004	errors deal with the mechanisms that process the <i>business transaction</i> and
2005	will occur after message verification. Typically the rules and constraints
2006	applied to the message will deal with the semantics of message elements and
2007	the validity of the request itself. The content is not valid with respect to a
2008	responding role's business rules.
2009 2010	An Acceptance Exception terminates the business transaction. The following are business protocol exceptions:
2011	 Business exception. The business rules of the responding
2012	activity are violated. The application refused to process the
2013	incoming business document. Most often because it violated
2014	some pre-processing business rules.
2015	 Performance exceptions. The requested business action
2016	cannot be performed. The application may not be available.
2017 2018 2019	Typically, an Acceptance Exception means that the processing application (usually unknown to the other party) received the corresponding business document but was enable to process them.
2020	A Business Transaction is defined in very atomic and deterministic terms. It
2021	always is initiated by the requesting role, and will always conclude at the
2022	requesting role. Upon receipt of the required response and/or signals, or time-
2023	out of same, the requesting role can unambiguously determine the success or
2024	failure of the Business Transaction. A responding role that encounters an
2025	Acceptance Exception signals the exception back to the requesting role and
2026	then terminates the business transaction.
2027 2028 2029	Conversely, a requesting role that encounters an Acceptance Exception signals the exception back to the responding role and terminates the transaction

2050							
2031	5.14.2.3 BSI compliance						
2032							
2033	A BS	I needs to comply specifically with the following parameters to produce					
2034	the associated special exceptions. The requesting and responding roles take						
2035	different action as per below.						
2036		IsAuthorizationRequired					
2037		If a partner role needs authorization to request a business					
2038		action or to respond to a business action then the sending					
2039		partner role must sign the business document exchanged and					
2040		the receiving partner role must validate this business control					
2041		and approve the authorizer. A responding partner must signal					
2042		an authorization exception (receipt exception) if the requesting					
2043		partner role is not authorized to perform the business activity.					
2044		A sending partner must send notification of failed authorization					
2045		if a requesting partner is not authorized to perform the					
2046		responding business activity.					
2047		IsNonRepudiationRequired					
2048		If non-repudiation of origin and content is required then the					
2049		business activity must store the business document in its					
2050		original form for the duration mutually agreed to in a trading					
2051		partner agreement. A responding partner must signal a receipt					
2052		exception if the sending partner role has not properly delivered					
2053		their business document. Similarly, a requesting partner must					
2054		send receipt exception if a responding partner has not properly					
2055 2056		delivered their business document. isNonRepudiationOfReceiptRequired.					
2057		Both partners agree to mutually verify receipt of a requesting					
2058		business document and that the receipt must be non-					
2059 2060		repudiable. A requesting partner must initiate a notification of failure business transaction business (possibly revoking a					
2000		contractual offer) if a responding partner has not properly					
2001		delivered signed their receipt. For a further discussion of					
2062		nonrepudiation of receipt, see also the ebXML E-Commerce					
2064		and Simple Negotiation Patterns.					
2065							
2066		Non-repudiation of receipt provides the data for the following					
2067		audit controls.					
2068		Verify responding role identity (authenticate) – Verify the					
2069		identity of the responding role (individual or organization) that					
2070		received the requesting business document.					
2071		Verify content integrity – Verify the integrity of the original					
2072		content of the business document request.					
2073							
2074							
2075		isPositiveResponse					
2076		An expression whose evaluation results in TRUE or FALSE. If					
2077		TRUE this DocumentEnvelope is intended as a positive					
2078		response to the request. If isPositiveResponse = FALSE, the					

2079	business transaction activity ends in business failure mode.
2080	The value for this parameter supplied for a DocumentEnvelope
2081	is an assertion by the sender of the DocumentEnvelope
2082	regarding its intent for the transaction to which it relates, but
2083	does not bind the recipient, or override the computation of
2084	transactional success or failure.

2085 5.14.3 Computation of the status of a Business Transaction
 2086 Activity
 2087

2094	The values of the enumeration of the state of a business transaction of the
2095	conditionGuard on a transition are:
2096	ProtocolSuccess
2097	AnyProtocolFailure
2098	 RequestReceiptFailure
2099	 RequestAcceptanceFailure
2100	 ResponseReceiptFailure
2101	 ResponseAcceptanceFailure
2102	 SignalTimeout
2103	 ResponseTimeout
2104	 BusinessSuccess (isPositiveResponse=true or no isPositiveResponse
2105	attribute)
2106	 BusinessFailure(isPositiveResponse=false)
2107	 Success (both protocol and business success)
2108	 Failure (AnyProtocolFailure or BusinessFailure).
2109	
2110	This figure does not represents the retryCount semantics.
2111	
2112	BusinessFailure assumes that the transaction was successful from a
2113	"protocol" perspective, meaning that the state between the two parties could
2114	be effectively synchronized. However, the intent of the response was
2115	negative with respect to the request. As we mentioned earlier, this is an
2116	optional qualification of the response, agreed upon at design time, and some
2117	messages may not be qualifiable, i.e. they are neither positive or negative.
2118	The way business document specifications are designed allows to define two
2119	"logicial" documents from the same physical document and a condition
2120 2121	expression evaluated at run-time by the BSI. If the condition is true and
2121 2122	isPositiveResponse = false, then the transaction ends in business failure
2122	based on the business document content. Of course entire documents can be directly associated with isPositiveResponse=false, not just when they contain
2123	
2124	a particular field value.
2123	It is required that each business transaction activity be designed such that
2120	there is at a minimum two transitions from the business transaction activity,
2127	one with a conditionGuard with a Success value, the other one with a Failure
2120	value, even if in case of failure the transitions goes to the failure state of the
212)	collaboration.
0101	E 45 Duntime Celleboration Semantice

2131 **5.15 Runtime Collaboration Semantics**

- 2132 The ebXML collaboration semantics contain a number of relationships
- between multiparty collaborations and binary collaborations, between
- 2134 recursive layers of binary collaborations, and choreographies among 2135 transactions in binary collaborations. It is anticipated that over time BSI
- transactions in binary collaborations. It is anticipated that over time BSI software will evolve to the point of monitoring and managing the state of a
- 2137 collaboration, similar to the way a BSI today is expected to manage the state
- 2138 of a transaction. For the immediate future, such capabilities are not expected
- and not required.

2140 **5.16** Where the ebXML Business Process Specification

2141Schema May Be Implemented

- 2142 The ebXML Business Process Specification Schema should be used
- 2143 wherever software is being specified to perform a role in an ebXML business
- 2144 collaboration. Specifically, the ebXML Business Process Specification

- 2145 *Schema* is intended to provide the business process and document 2146 specification for the formation of ebXML trading partner Collaboration 2147
- 2147 Protocol Profiles and Agreements.
- 2148However, the ebXML Business Process Specification Schema may be used2149to specify any electronic commerce collaboration. It may also be used for2150non-commerce collaborations, for instance in defining transactional2151collaborations among non-profit organizations or between applications, within2152the enterprise.
- Every BSI which is in the position of sending a signal or a document envelop shall verify if sending this message will violate the business transaction definitions and shall not send it if such a condition is detected. For instance sending a signal or a response after a timeout has occurred is prohibited. Similarly, sending a receipt on a document envelop which do not have the same digest as the original document envelop is prohibited. Rather, the BSI should send an exception back to the BSI that initiated the particular
- 2160 message.
- As of the current version, an ebXML compliant BSI is not requested that BSI be able to support multi-party collaboration. The current specification does
- 2162 be able to support multi-party conaboration. The current 2163 not support the notions of context and correlation.
- 2164

2165 **5.17 Guidelines for Business Service Interface Interoperability**

- 2166We have taken great care in this new version of the specification to2167distinguish what is executable and computable versus general expressions2168written in text and associated with model elements. In particular, we exclude,2169beginsWhen, endsWhen, preCondition and postCondition from the2170written in text and associated with model elements. In particular, we exclude,
- 2170 responsibility of a BSI. 2171
- Another important point for interoperability is that the context of a binary
 collaboration is limited to the document flows that are received or sent by the
 BSI. The BSI do not need to query information in other systems, internal or
 external to calculate the result of condition expressions.
- 217621772177217821782178217921792180218021812181218221822182218221822181218221822181218221822181218221812182218121822181218221812182218121822182218121822182218221812182218121822182218121822182218221832184218421842185218521812182218221822183218421842184218521852186218721802181218121822182218321842184218521852186218721802181218121822182218321842184218421852186218621872187</
- 2183

2184 **5.18** Collaboration and transaction well-formedness rules

- 2185The following rules should be used in addition to standard parsing to properly2186constrain the values of the attributes of the elements in an ebXML Business2187Process Specification.
- 2188 Business Transaction
- 2189[0] If non-repudiation is required then the input or returned business2190document must be a tamper-detectable entity.

2191	 If authorization is required then the input business document and
2192	business signal must be an authenticated or a tamper detectable
2193	secure entity.
2194 2195 2196	[2] The time to acknowledge receipt must be less than the time to acknowledge acceptance if both properties have values.
2197	[3] If the time to acknowledge acceptance is null then the time to
2198	perform an activity must be greater than the time to acknowledge
2199	receipt.
2200	[4] The time to perform a transaction cannot be null unless it is
2201	specified to be request without a response.
2202	[5] If non-repudiation of receipt is required then the time to
2203	acknowledge receipt cannot be null.
2204	[6] The time to acknowledge receipt, time to acknowledge acceptance
2205	and time to perform cannot all be zero.
2206	BusinessActivity
2207	[7] Completion states must be defined on mutually exclusive paths
2208	guarantying that only one of the completion state will be reached.
2209	[8] A BusinessActivity may have any number of incoming transition
2210	but only one output transition. Either a Fork or Decision business
2211	states must be used to logically specify more than one outgouing
2212	transition.
2213	Business Collaboration
2214	[9] There must be at most one Start business state in a binary
2215	collaboration definition.
2216	[10] There must be at least one Completion state in a binary
2217	collaboration definition
2218	[11] A Role cannot perform both roles of the same business
2219	transaction activity.
2220	[12] The two roles associated with a business collaboration must be
2221	different
2222	

6 ebXML Business Process Specification Schema – 2223

- In this section we describe the XML Schema version of the Specification 2224 2225 Schema.
 - An example XML Business Process Specification listed in Appendix A •
 - A table listing all the elements with definitions and parent/child • relationships
 - A table listing all the elements, each with a cross reference to the • corresponding class in the UML version of the specification schema
 - Rules about namespaces and element references •

namespace

http://www.untmg.org/downloads/General/approved/BPSS-v1pt10.xsd

An optional attachment to a BusinessDocument in a DocumentEnvelope. Description

> Recommendation: Either use businessDocument +businessDocumentIDREF attributes OR use specification +mimeType attributes.

children **Documentation**

used by	element Docu	<u>imentEnvelope</u>			
attributes	Name name nameID businessDocum ent	Type xsd:string GUID xsd:string	Use required required	Default	Annotation Defines the name of the attachment. GUIID version of name A BusinessDocument can define an Attachment's type. If it is not of a defined Business Document, the mime type and specification attribute will be the only indication of its type.
	businessDocum entIDREF	GUIDREF			The GUIIDREF version of businessDocument
	specification	xsd:anyURI			A reference to an external source of description of this attachment.
	mimeType	xsd:string	optional		Defines the valid MIME (Multipurpose Internet Mail Extensions) type of this Attachment. Example: 'application/pdf'
	isAuthenticated	xsd:NMTOKEN			There is a digital certificate associated with the document entity. This provides proof of the signer's identity. (See also section on Document Security)
	isConfidential	xsd:NMTOKEN			The information entity is encrypted so that unauthorized parties cannot view the information(See also section on Document Security)
	isTamperDetect able	xsd:NMTOKEN			The information entity has an encrypted message digest that can be used to check if the message has been tampered with. This requires a digital signature (sender's digital certificate and encrypted message digest) associated with the document entity.(See also section on Document Security)

	diagram BusinessTransaction RequestingBusinessActivity RespondingBusinessActivity					
	namespace	http://www.untmg	.org/downloads/Ger	eral/approved/BP	SS-v1pt10.xsd	
	Description	A business transaction is a set of business information and business signal exchanges amongst two commercial partners that must occur in an agreed format, sequence and time period. If any of the agreements are violated then the transaction is terminated and all business information and business signal exchanges must be discarded. Business Transactions can be formal as in the formation of on-line offer/acceptance commercial contracts and informal as in the distribution of product announcements. A BusinessTransaction can be performed by many BusinessTransactionActivites. A BusinessTransaction has exactly one RequestingBusinessActivity. A BusinessTransaction has exactly one RespondingBusinessActivity

http://www.untmg.org/downloads/General/approved/BPSS-v1pt10.xsd namespace

type extension of BusinessActivity

Description A business transaction activity defines the use of a business transaction within a binary collaboration. A business transaction activity is a business activity that executes a specified business transaction. More than one instance of the same business transaction activity can be open at one time if the isConcurrent property is true. A Role may not be both the requestor and the responder in a business transaction. children **Documentation**

ciliaren	Documentation				
used by	element Bina	ryCollaboration			
attributes	Name name	Type xsd:string	Use required	Default	Annotation Defines the name of the activity uniquely within the binary collaboration
	nameID	GUID			The GUID version of the name
	fromRole	xsd:string	required		The name of the initiating role in Business Transaction Activity. This must match one of the roles of the binary collaboration and will become the requestor in the BusinessTransaction performed by this activity
	fromRoleIDREF	GUIDREF			The GUIDREF version of fromRole
	toRole	xsd:string	required		The name of the responding role in Business Transaction Activity. This must match one of the roles in the binary collaboration and will become the responder in the BusinessTransaction performed by this activity
	toRoleIDREF	GUIDREF			The GUIDREF version of toRole
	beginsWhen	xsd:string			A description of an event external to the collaboration that normally causes this collaboration to commence
	endsWhen	xsd:string			A description of an event external to this collaboration that normally causes this collaboration to conclude
	preCondition	xsd:string			A description of a state external to this collaboration that is required before this collaboration can commence
	postCondition	xsd:string			A description of a state that does not exist before the execution of this collaboration but will exist as a result of the execution of this collaboration
	businessTransa ction	xsd:string	required		A reference, by name to the Business Transaction performed by this Business Transaction Activity
	businessTransa ctionIDREF	GUIDREF			A GUIDREF reference to the Business Transaction GUID
	isConcurrent	xsd:boolean		true	If the BusinessTransactionActivity is concurrent then more than one instance of the associated BusinessTransaction can be open the same time as part of the execution of this Business Transaction Activity regardless of the Binary Collaboration instance
	isLegallyBinding	xsd:boolean		true	Defines whether the Business Transaction performed by this activity is intended by the trading parties to be binding. Default value is True.
	timeToPerform	xsd:duration			The period of time, starting upon the sending of the request, within which the response will be sent back

2331 6.2 XML to UML cross-reference

2332

The following is a table that references the XML element names in the XSD to their counterpart classes in the UML specification schema.

XML Element	UML Class
Attachment	Attachment
Role	AuthorizedRole
Binary Collaboration	Binary Collaboration
BusinessPartner Role	BusinessPartner Role
Business Transaction Activity	Business Transaction Activity
Business Transaction	Business Transaction
Responding BusinessActivity	Responding BusinessActivity
Requesting BusinessActivity	Requesting BusinessActivity
Collaboration Activity	Collaboration Activity
DocumentEnvelope	DocumentEnvelope
Documentation	None (Should be added)
ebXML Process Specification	(From Package model: ebXML Process Specification)
Failure	Failure
Include	(From Package model: Include)
MultiParty Collaboration	MultiParty Collaboration
Package	(From Package model: Package)
Performs	Performs
Schema	Schema
Decision	Decision
Fork	Fork
Start	Start
Success	Success
Join	Join
Transition	Transition
BusinessAction	BusinessAction
DocumentSecurity	DocumentSecurity

2335The following classes in the UML specification schema are abstract, and do2336not have an element equivalent in theSchema. Only their concrete subtypes2337are in the Schema

- BusinessState
- CompletionState

• BusinessActivity

2341 6.3 Scoped Name Reference

- The structure of ebXML Business Process Specification Schema encourages re-use. A BPSS instance can include another BPSS instance by reference.
- In addition the contents of a BPSS instance can be arranged in a recursive
 package structure. The ebXMLProcessSpecification element is a package
 container, so it can contain packages within it. Package in itself is also a
 package container, so it can contain further packages within it.
- 2348 Packages function as namespaces as per below.
- Finally a Package, at any level can have PackageContent. Types of Package
 Content are BusinessDocument, BusinessTransaction, BinaryCollaboration,
 MultiPartyCollaboration.
- Package Content is always uniquely named within a package. Lower level elements are uniquely named within their parent PackageContent.
- 2354Each Package Content type is a built-in context provider for the Logical Model2355for the Business Document definitions referenced by this ebXML
- 2356 ProcessSpecification.
- 2357 Within an ebXML BPSS instance the following applies to naming:
- 2358 Specification elements reference other specification elements by name 2359 through the use of attributes. The design pattern is that elements have a 2360 name attribute and other elements that reference the named elements do so 2361 through an attribute defined as the lowerCamelCase version of the 2362 referenced element (e.g. Role has attribute name while Performs, which 2363 references Role, has attribute role). Two types of attributes are provided for names and references, XML GUID/GUIDREF based and plain text. Each 2364 2365 named element has a required name attribute and an optional nameID 2366 attribute. Referencing elements have lowerCamelCase and 2367 lowerCamelCaseIDREF attributes for the referenced element. XML GUID/GUIDREF functionality requires all IDs to be globally unique and that all 2368 2369 GUIDREFs point to a defined GUID value. Plain text attributes do not have 2370 this capability and may result in duplicate names. To unambiguously identify 2371 a referenced element using plain text attribute in the referencing attribute it is 2372 strongly recommended that XPath syntax be used. However, this is not enforced in the Schema. 2373
- 2374The purpose of providing both solutions is to facilitate creation of BPSS2375instance documents directly in XML and to support future development tools2376that can automatically assign machine readable nameIDs and references.2377Both styles can be used simultaneously, in which case the GUID and2378GUIDREF versions provide the unambiguous referencing and the plain text2379versions are used to provide meaningful names. Examples of named2380elements and references:

2381 2382 2383 2384 2385 2386 2386 2387	<package name="ebXMLOrdering"> <binarycollaboration name="OrderCollaboration" nameID="b112"> <role name="buyer" nameid="r224"></role> <role name="seller" nameid="r225"></role> </binarycollaboration </package>
2387	

2389 2390 2391 2392 2393 2394 2395 2396 2397 2398 2399 2400	-the XPath approach <performs Role='//Package[@name="OAGOrdering"]/BinaryCollaboration[@name="OrderCollaboration"]/ Role[@name="buyer"]'/> <!---Combination approach--> <performs role="buyer" roleidref="r224"></performs> It is not required to use the full path specification as shown above, other forms of XPath expressions could be used as long as they resolve to a single reference. For example if buyer was unique to the document then the XPath</performs
2401 2402 2403 2404 2405 2406	<pre>could have been: <performs role='//Role[@name="buyer"]'></performs> Relative paths are also allowed for example: <businesstransactionactivity <br="" fromrole='/ Role[@name="buyer"]'> /></businesstransactionactivity></pre>

2407 6.4 Sample XML document against above Schema

2408 2409

Provided in Appendix A

2411 **7 Business signal structures**

2412 The ebXML Message Service Specification signal structures provide business 2413 service state alignment infrastructure, including unique message identifiers and 2414 digests used to meet the basic process alignment requirements. The business signal 2415 payload structures provided herein are optional and normative and are intended to 2416 provide business and legal semantic to the business signals. Since signals do not 2417 differ in structure from business transaction to business transaction, they are defined 2418 once and for all, and their definition is implied by the conjunction of the Business 2419 Process Specification Schema and Message Service Specification. Here are the 2420 Schemas for business signal payload for ReceiptAcknowledgment and for 2421 AcceptanceAcknowledgement and Exception. 2422 An Exception message would be sent in lieu of a ReceiptAcknowledgement signal or

An Exception message would be sent in lieu of a ReceiptAcknowledgement signal or
 an AcceptanceAcknowledgment signal and would indicate a corresponding negative
 ReceiptAcknowledgement or negative AcceptanceAcknowledgement. On the other
 hand, sending a ReceiptAcknowledgment or AcceptanceAcknowledgement message
 as defined below would indicate a positive signal.

2581 7.1.2 ReceiptAcknowledgment Signal Schema

2583 7.1.3 AcceptanceAcknowledgement Signal Schema 2584

"Exception I ype" is used to identify various exceptions that can occur during the execution of binary collaboration. Run time processing engine executing BPSS based collaborations generates a "ReceiptException" if request message results in a negative receipt acknowledgment cause of various problems like "Syntax validation" of business message", "Unauthorized execution of process", "Failure of Signature validation in incoming message", "Out of sequence message" corresponding respectively to "Syntax", "Authorization", "Signature", "Sequence".

Run time processing engine executing BPSS based collaborations generates a "AcceptanceException" if request message results in a negative acceptance acknowledgment cause of various problems. Please refer the the specification for various reasons why negative acceptance acknowledgment may be sent.

Run time processing engine executing BPSS based collaborations can send a "GeneralException" if processing of a request message results in a state where further processing can not continue.

"Reason" can be used to send a message to convey the reason for exception being generated. "ExceptionMessage" can include a descriptive message corresponding to the exception

	<xsd:enumeration value="Syntax"></xsd:enumeration>

2591

2592 **8 EDI support**

A technical report will be made available to describe use of BPSS to describe EDI transactions.

2595 9 Production Rules

- 2596This section provides a set of production rules, defining the mapping from the2597UML version of the Business Process Specification Schema to the XML2598version.
- The primary purpose for these production rules is to govern the one-time
 generation of the schema version of the *Business Process Specification Schema* from the UML Class Diagram version of *Business Process Specification Schema*.
- 2603 The Class Diagram version of Business Process Specification Schema is not 2604 intended for the direct creation of ebXML Business Process Specifications. 2605 However, if a Business Process Specification was in fact (programmatically) 2606 created as an instance of this class diagram, the production rules would also 2607 provide the prescriptive definition necessary to translate a such an instance 2608 into a XML Specification Document conformant with theSchema. The 2609 production rules are defined for concrete classes, abstract classes, aggregate 2610 associations, specialization associations and unidirectional associations.
- 2611 1. Classes are rendered as XML elements.
- 2612
 2613
 2613
 2614
 2. Class attributes are rendered as XML attributes. NOTE: occurrence requirements (required vs optional) and default values for attributes are not modeled.

2615 2616 2617 2618	3.	Specialization classes (classes that inherit from another class) are rendered as XML elements including all attributes and aggregate associations from the base class. Repeated attributes are normalized to a single occurrence.
2619 2620 2621 2622	4.	Abstract classes are not rendered in the XML Schema. Abstract classes are inherited from and represent a form of collection. A class that aggregates an abstract class, essentially aggregates "any of each" of the specialization classes.
2623 2624	5.	An aggregate association renders the aggregated class as an XML child element with appropriate cardinality.
2625 2626 2627 2628	6.	A unidirectional association defines an attribute in the originating class of the same name as the class the association points to. This type of attribute is called a "reference attribute" and contains the name of the class it points to. The referenced class must have a "name" attribute.
2629 2630 2631 2632	7.	A class attribute data type, that has a class of the same name with stereotype < <enumeration>> is rendered as an XML attribute enumeration. The Enumeration class does not have an explicit association.</enumeration>
2633 2634 2635	8.	A class attribute data type (e.g. Time, URI, Boolean) that has no corresponding class definition is rendered as a string in theSchema. In the XML Schema version these data types are mapped as:
2636 2637 2638		Time - xsd:duration URI - xsd:anyURI Boolean - xsd:boolean
2639 2640 2641	9.	Each class is given an optional "Documentation*" element which is intended for annotation of the specification instances. This is not modeled.
2642
