This specification is related to:

- IETF RFC5545, ICalendar
- IETF RFC5546, ICalendar Transport
- IETF RFC2447, ICalendar Message Based Interoperability
- IETF XCAL specification in progress
- IETF / CalConnect Calendar Resource Schema specification in progress
- 

#### Declared XML Namespace(s):

<http://docs.oasis-open.org/ns/ws-calendar>

<http://docs.oasis-open.org/ns/ws-calendar/timestamp>

#### Abstract:

WS-Calendar describes a limited set of message components and interactions providing a common basis for specifying schedules and intervals to coordinate activities between services. The specification includes service definitions consistent with the OASIS SOA Reference Model and XML vocabularies for the interoperable and standard exchange of:

- Schedules, including sequences of schedules
- Intervals, including sequences of intervals

These message components describe schedules and intervals future, present, or past (historical). The definition of the services performed to meet a schedule or interval depends on the market context in which that service exists. It is not in scope for this TC to define those markets or services.

**Status:**

This document was last revised or approved by the WS-Calendar Technical Committee on the above date. The level of approval is also listed above. Check the “Latest Version” or “Latest Approved Version” location noted above for possible later revisions of this document.

Technical Committee members should send comments on this specification to the Technical Committee’s email list. Others should send comments to the Technical Committee by using the “Send A Comment” button on the Technical Committee’s web page at <http://www.oasis-open.org/committees/ws-calendar/>.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (<http://www.oasis-open.org/committees/ws-calendar/ipr.php>).

The non-normative errata page for this specification is located at <http://www.oasis-open.org/committees/ws-calendar/>.

# 1 Introduction

One of the most fundamental components of negotiating services is agreeing when something should occur, and in auditing when they did occur. Short running services traditionally have been handled as if they were instantaneous, and have handled scheduling through just-in-time requests. Longer running processes, including physical processes, may require significant lead times. When multiple long-running services participate in the same business process, it may be more important to negotiate a common completion time than a common start time. Pre-existing approaches that rely on direct control of such services by a central system increases integration costs and reduce interoperability as they require the controlling agent to know and manage multiple lead times.

Not all services are requested one time as needed. Processes may have multiple and periodic occurrences. An agent may need to request identical processes on multiple schedules. An agent may request services to coincide with or to avoid human interactions. Service performance be required on the first Tuesday of every month, or in weeks in which there is no payroll, to coordinate with existing business processes. Service performance requirements may vary by local time zone. A common schedule communication must support diverse requirements.

Physical processes are already being coordinated by web services. Building systems and industrial processes are operated using oBIX, BACnet/WS, LON-WS, OPC XML, and a number of proprietary specifications including TAC-WS, Gridlogix EnNet, and MODBUS.NET. In particular, if building systems coordinate with the schedules of the building's occupants, they can reduce energy use while improving performance.

An increasing number of specifications envision synchronization of processes through mechanisms including broadcast scheduling. Efforts to build an intelligent power grid (or smart grid) rely on coordinating processes in homes, offices, and industry with projected and actual power availability; mechanisms proposed include communicating different prices at different times. Several active OASIS Technical Committees require a common means to specify schedule and interval: Energy Interoperation (EITC) and Energy Market Information Exchange (EMIX). Emergency management coordinators wish to inform geographic regions of future events, such as a projected tornado touchdown, using EDXL. The open Building Information Exchange specification [oBIX] lacks a common schedule communications for interaction with enterprise activities. These and other efforts would benefit from a common cross-domain, cross specification standard for communicating schedule and interval.

For human interactions and human scheduling, the well-known iCalendar format is used to address these problems. Prior to WS-Calendar, there has been no comparable standard for web services. As an increasing number of physical processes become managed by web services, the lack of a similar standard for scheduling and coordination of services becomes critical.

The intent of the WS-Calendar technical committee was to adapt the existing specifications for calendaring and apply them to develop a standard for how schedule and event information is passed between and within services. The standard adopts the semantics and vocabulary of iCalendar for application to the completion of web service contracts. WS Calendar builds on work done and ongoing in The Calendaring and Scheduling Consortium (CalConnect), which works to increase interoperation between calendaring systems.

Everything with the exception of all examples, all appendices, and the introduction is normative.

## 1.1 Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119]

### 117 1.4 Naming Conventions

118 This specification follows some naming conventions for artifacts defined by the specification, as follows:

119 For the names of elements and the names of attributes within XSD files, the names follow the  
120 camelCase<sup>1</sup> convention, with all names starting with a lower case letter, eg

```
121 <element name="componentType" type="WS-Calendar:ComponentType"/>
```

122 For the names of types within XSD files, the names follow the CamelCase convention with all names  
123 starting with an upper case letter, e.g.,

```
124 <complexType name="ComponentService">
```

125 For the names of intents, the names follow the CamelCase convention, with all names starting with a  
126 lower case letter, EXCEPT for cases where the intent is to represent an established acronym, in which  
127 case the entire name follows the usage of the established acronym.

128 An example of an intent which references an acronym is the "SOAP" intent.

### 129 1.5 Architectural References

130 WS-Calendar assumes incorporation into services. Accordingly it assumes a certain amount of definitions  
131 of roles, names, and interaction patterns. This document relies heavily on roles and interactions as  
132 defined in the OASIS Standard *Reference Model for Service Oriented Architecture [SOA-RM]*.

---

<sup>1</sup> Common term - see Wikipedia for explanation.

---

## 133 2 Overview of WS-Calendar

134 A calendar communication without a real world effect<sup>2</sup> is of little interest. That real world effect is the result  
135 of a services execution context within a policy context. Practitioners can use WS-Calendar to add  
136 communication of schedule and interval to the execution context of a service. Use of WS-Calendar will  
137 align the performance expectations between execution contexts in different domains. The Technical  
138 Committee intends for other specifications and standards to incorporate WS-Calendar, bringing a  
139 common scheduling context to diverse interactions in different domains

### 140 2.1 Approach taken by the WS-Calendar Technical Committee

141 The Technical Committee (TC) based its work upon the iCalendar specification as updated in 2009 (IETF  
142 **[RFC5545]** and its the XML serialization **[XCAL]**, currently (2010-07) on a standards track in the IETF.  
143 Members of the Calendaring and Scheduling Consortium (CalConnect.org) developed both updates to  
144 IETF specifications and provided advice to this TC. This work provides the vocabulary for use in this  
145 specification.

146 The committee solicited requirements from a range of interests, notably the NIST Smart Grid Roadmap  
147 and the requirements of the Smart Grid Interoperability Panel (SGIP) as developed by the North  
148 American Energy Standards Board (NAESB). Others submitting requirements included members of the  
149 oBIX technical committee and representative of the FIX Protocol Association. These requirements are  
150 reflected in the semantic elements described in Chapters 3 and 4.

151 In a parallel effort, the CalConnect TC-XML committee developed a number of schedule and calendar-  
152 related services. CalConnect drew on its experience in interoperability between enterprise calendaring  
153 systems as well as interactions with web-based calendars and personal digital assistants (PDAs). These  
154 services were developed as RESTfull (using **[REST]**)services by CalConnect and contributed to the WS-  
155 Calendar TC.

### 156 2.2 Scheduling Service Performance

157 Time semantics are critical to WS-Calendar. Services requested differently can have different effects on  
158 performance even though they appear to request the same time interval. This is inherent in the in the  
159 concept of a service oriented architecture.

160 As defined in the OASIS Reference Model for Service Oriented Architecture 1.0<sup>3</sup>, service requests access  
161 the capability of a remote system.

162 *The purpose of using a capability is to realize one or more real world effects. At its core, an*  
163 *interaction is “an act” as opposed to “an object” and the result of an interaction is an effect (or a*  
164 *set/series of effects). This effect may be the return of information or the change in the state of*  
165 *entities (known or unknown) that are involved in the interaction.*

166 *We are careful to distinguish between public actions and private actions; private actions are*  
167 *inherently unknowable by other parties. On the other hand, public actions result in changes to the*  
168 *state that is shared between at least those involved in the current execution context and possibly*  
169 *shared by others. Real world effects are, then, couched in terms of changes to this shared state*

170 A request for remote service performance is a request for specific real world effects. Consider two service  
171 providers that offer the same service. One must start planning an hour or more in advance. The second  
172 may be able to achieve the service in five minutes. The service start time is the time when that service

---

<sup>2</sup> This paragraph includes a number of terms of art used in service oriented architecture (SOA). In all cases, the terms are as defined in the *Reference Model for Service Oriented Architecture*, found in the normative references.

<sup>3</sup> See normative references in section 1.2

173 becomes available. If we do not distinguish these circumstances, then the customer would receive quite  
174 different quite different services with no distinctions in the service contract.

175 The complement of this is the scheduled end time. The party offering the service may need to ramp down  
176 long running processes. Using for example energy demand response, if a system contracts to end energy  
177 use by 3:00, it assumes the onus of turning everything off before 3:00.

178 Duration is how long a behavior is continued. If a service contracts to provide shed load for an hour, it is  
179 not necessary for it to stop shedding load 65 minutes later (which may be the end of the work day). It  
180 must, however, shed the agreed upon load during all of the 60 minutes.

181 In this way, the service scheduled to shed load from 4:00 ending at 5:00 may be quite different than the  
182 one scheduled to shed load for an hour beginning at 4:00.

## 183 2.2.1 Which Time? UCT vs. Local Time

184 When 2 or more parties attempt to agree on a time - e.g., for a meeting, or when to provide a service,  
185 they agree to start at a particular instant of time UTC. They agree on that instant in time by converting  
186 from local time, e.g., they want a meeting to start at 13:00 Eastern, 18:00 UK. Our lives and the use of  
187 services are bound by local time not by UTC. To humans local time is the invariant and UTC is mapped  
188 on to it. If a government modifies the rules we adjust the mappings and we shift the UTC time. We still  
189 want to meet at 13:00 local or have the heating start at 07:00.

190 As long as the rules never change this causes no confusion—but they do. Recent experience has  
191 included considerable efforts when the rules for the start of Daylight Savings Time (DST) have changed.  
192 If all information is in UTC, and no record of the events basis in the local time and time zone remains,  
193 there is no way to re-compute existing contracts. We don't know if that UTC was calculated based on an  
194 old or new rule.

195 A triplet of Local time + timezoneid + (UTC or offset) always allows you to determine if the time is valid. If  
196 a recalculation of UTC for that local time + tzid results in a different value from that stored then  
197 presumably the DST rules have changed since the data was stored. If you can detect that the scheduled  
198 time is no longer valid you can take corrective action.

199 For simplicity, all examples and discussion in this document are based on Greenwich Mean Time also  
200 known as Coordinated Universal Time (UTC). The Technical Committee makes no representation as  
201 whether UTC or local time are more appropriate for a given interaction. Because WS-Calendar is based  
202 on **[iCalendar]**, business practices built upon WS-Calendar can support either.

203 Practitioners should consult **[Time Service Recommendations]** and **[Time Zone Service]** in the non-  
204 normative references.

## 205 2.3 Overview of This Document

206 The specification consists of a standard schema and semantics for schedule and interval information.  
207 Often the most important service schedule communications involve series of related services over time,  
208 which WS-Calendar defines as a Sequence. These semantic elements are defined and discussed in  
209 Section 3.

210 Section 4 introduces notions of performance, i.e. what does it mean to be “on time”. This section also  
211 describes the different ways to association a service request with each Interval in a Sequence.

212 Managing information exchanges about a Sequence of events can easily become cumbersome, or prone  
213 to error. WS-Calendar defines the Calendar Gluon, a mechanism for making assertions about all or most  
214 of the intervals in a sequence. Intervals can inherit from a Calendar Gluon, or they can override locally  
215 assertions inherited from the Calendar Gluon. Section 5 discusses inheritance and parsimony of  
216 communication and introduces contract scheduling.

217 In Sections 7-15, this document describes **[REST]**-based, (RESTfull) web services for interacting with  
218 remote calendars. These interactions are based upon the larger iCalendar message. The specification  
219 defines services for calendar inquiries, event scheduling, event updating, and event cancelation.

---

## 220 3 Intervals, Temporal Relations, and Sequences

221 WS-Calendar Elements are semantic elements derived from the [XCAL] specification. These elements  
222 are smaller than a full schedule interaction, and describe the intervals, durations, and time-related events  
223 that are relevant to service interactions. The Elements are used to build a precise vocabulary of time,  
224 duration, sequence, and schedule.

225 WS-Calendar elements elaborate the objects defined in iCalendar, to make interaction requirements  
226 explicit. For example, in human schedule interactions, different organizations have their own  
227 expectations. Meetings may start on the hour or within 5 minutes of the hour. As agents scheduled in  
228 those organizations, people learn the expected precision. In WS-Calendar, that precision must be explicit  
229 to prevent interoperability problems. WS-Calendar defines a performance element to elaborate the simple  
230 specification of [XCAL] to make explicit the performance expectations within a scheduled event.

231 WS-Calendar defines common semantics for recording and exchanging event information.

### 232 3.1 Core Semantics derived from [XCAL]

233 The iCalendar data format [RFC5545] is a widely deployed interchange format for calendaring and  
234 scheduling data. The [XCAL] specification (in process) standardizes the XML representation of iCalendar  
235 information. WS-Calendar relies on [XCAL] standards and data representation to develop its semantic  
236 components.

237 <http://ietfreport.isoc.org/idref/draft-daboo-et-al-icalendar-in-xml/>

#### 238 3.1.1 Time

239 Time is an ISO 8601 compliant time string with the optional accompaniment of a duration interval to  
240 define times of less than 1 second. Examples of the from the ISO 8601 standard include:

```
241 Year:  
242     YYYY (eg 1997)  
243 Year and month:  
244     YYYY-MM (eg 1997-07)  
245 Complete date:  
246     YYYY-MM-DD (eg 1997-07-16)  
247 Complete date plus hours and minutes:  
248     YYYY-MM-DDThh:mmTZD (eg 1997-07-16T19:20+01:00)  
249 Complete date plus hours, minutes and seconds:  
250     YYYY-MM-DDThh:mm:ssTZD (eg 1997-07-16T19:20:30+01:00)  
251 Complete date plus hours, minutes, seconds and a decimal fraction of a second  
252     YYYY-MM-DDThh:mm:ss.sTZD (eg 1997-07-16T19:20:30.45+01:00)
```

253 Normative information on [ISO 8601] is found in section 1.2.

254 The iCalendar Components (VComponents)

255 iCalendar and [XCAL] have a number of long defined component objects that comprise the payload  
256 inside of an iCalendar message. These include the VTODO, the VALARM, the VEVENT. These element  
257 names begin with "V" for historic reasons. The definitions and use of each of the vObjects is described in  
258 [RFC5545].

259 Because of its flexibility, the VTODO object is the basis for WS-Calendar objects for service performance.  
260 Because WS-Calendar services support all traditional iCalendar-based interactions (CalDAV, et al.), all  
261 VComponents SHALL be supported.

### 262 3.2 Intervals

263 Time Segments, i.e., increments of continuous passage of time, are a critical component of service  
264 alignment using WS-Calendar. There are many overloaded uses of terms about time, and within a

265 particular time segment, there may be many of them. Within this document, we use the term Time  
 266 Segments to encompass all the terms in Table 3-1, below.

267 The base data type for time segments is the Interval. The Interval is a time segment defined by the  
 268 Duration element as defined in [XCAL]. The [XCAL] duration is a data type based upon the string  
 269 representation in the iCalendar duration. The Committee listened to arguments that we should redefine  
 270 the use and meaning of Duration. Whatever their merit, the iCalendar Duration has a pre-existing  
 271 meaning of the length of time of scheduled within an event. In this section, the Duration is enumerated as  
 272 one of several time segments.

273 *Table 3-1: Defining Time Segments for WS-Calendar*

Time Segment	Definition
<b>Duration</b>	Well-known element from iCalendar and [XCAL], Duration is the length of an event scheduled using iCalendar or any of its derivatives. The [XCAL] duration is a data type using the string representation defined in the iCalendar duration. The Duration is the sole descriptive element of the VTODO object that is mandatory in the Interval.
<b>Interval</b>	The Interval is a single duration supported by the full information set of the VTODO object as defined in iCalendar ([RFC5545]) and refined in [XCAL]. A WS-Calendar interval must include a Duration.
<b>Sequence</b>	A Sequence is a set of Intervals with defined temporal relationships. Sequences may have gaps between Intervals, or even simultaneous activities. A sequence is re-locatable, i.e., it does not have a specific date and time. A Sequence may consist of a single interval.
<b>Scheduled Sequence</b>	A Scheduled Sequence is a Sequence that is anchored by a specific date and time, that is, it is a Sequence with a start date and time. Specific performance of a Sequence against a service contract always occurs in a Scheduled Sequence.
<b>Partition</b>	A Partition is a set of consecutive intervals. A Partition includes the trivial case of a single Interval. A Partition is used to define a single service or behavior which varies over time. Examples include energy prices over time and or energy usage over time. A Partition is re-locatable, i.e., it does not have a specific date and time.
<b>Scheduled Partition</b>	A Scheduled Partition is a Partition that is anchored by a specific date and time, that is, it is a Partition with a start date and time. The Performance of a Partition against an executed service contract always occurs in a Scheduled Partition.

### 274 1.1.1 Intervals: the Basic Time Segment

275 An interval specifies how long an activity lasts. An Unscheduled Interval is not linked to a specific date  
 276 and time. Intervals are derived from the [iCalendar] Component VTODO. For ease of reference, the  
 277 required elements from the VTODO object are summarized here. Nothing in this section supersedes  
 278 [RFC5545] or the [XCAL] specification. Implementers SHALL refer to those respective specifications  
 279 [RFC5545] and the [XCAL] specifications for the normative description and definitions.

280 While all elements of the VTODO component are legal in WS-Calendar, certain elements are critical when  
 281 invoking services. These elements and their definitions within WS-Calendar are listed in *Table 3-2:*  
 282 *VTODO properties in Intervals.*

283 *Table 3-2: VTODO properties in Intervals*

Elements	Use	Use in WS-Calendar
<b>dtstamp</b>	Mandatory	

Elements	Use	Use in WS-Calendar
<b>x-wscalendarType</b>	Mandatory xs:string, value always "Interval"	Added vtodo attribute, ignored by iCalendar processors
<b>uid</b>	Mandatory	Used to enable unambiguous referencing by other components
<b>dtstamp</b>	xcal:dtstamp Optional	Identifies when Interval object was created
<b>duration</b>	xcal:duration Optional	Identifies length of time for Interval
<b>dtStart</b>	Optional	Scheduled start date and time for interval
<b>dtEnd</b>	Ignored	Legal for compatibility only. WS-Calendar does not use dtend.
<b>attach</b>	Mandatory, Multipleoccurs	In [xCal], any attachment. In WS-Calendar, restricted to the Attachment object as defined in section 4.
<b>x-wscalendarrelation</b>	temporalRelation. Optional compound element	Defines temporal relations to other components. Temporal Relations and their use to define Sequences are described in section 3.3.

284 An interval specifies how long an activity lasts. An Unscheduled Interval is not linked to a specific date  
285 and time. The example below shows the components section of a WS-Calendar event containing a single  
286 interval

287 *Example 1: An Interval*

```

288 <components>
289 <vtodo>
290   <properties>
291     <x-wscalendartype>Interval</x-wscalendartype>
292     <uid>
293       <text>00959BC664CA650E933C892C@example.com</text>
294     </uid>
295     <description>
296       <text>Sample Contract</text>
297     </description>
298     <duration>
299       <duration>
300         <duration>T10H</duration>
301       </duration>
302     </duration>
303   </properties>
304 </vtodo>
305 </components>

```

306 Note that no start time is specified, and no relationship. Relationships are not mandatory until an interval  
307 is incorporated into a Sequence.

### 308 3.3 Temporal Relations between Intervals

309 Many iCalendar communications involve more than one vComponent. In iCalendar interactions there are  
310 few components they have stereotypical interactions. For example, a vAlarm may be associated with a  
311 vevent. The registered relationships for iCalendar components are PARENT and Child. In [XCAL], these  
312 are usually expressed as:

```

313 <relationship>
314   <uid>aaaaaaaa1</uid>
315   <reltype>PARENT</reltype>

```

316

```
</relationship>
```

317 WS-Calendar defines additional relationships to describe how intervals relate in time. These Temporal  
318 Relationships express the order of performance and to declare the spacing between any two intervals.  
319 These relationships are referred to as the temporal relationships between components.

320

Table 3-3: Temporal Relationships in WS-Calendar

Temporal Relationship	Short Form	Definition
<b>finishToStart</b>	FS	As soon as the related Component finishes, this interval begins.
<b>finishToFinish</b>	FF	Used without gap when two components must finish at the same time. If there is a gap, it indicates that the referring component will finish execution a duration after the referred-to component.
<b>startToFinish</b>	SF	This component must Finish before the related component starts.
<b>startToStart</b>	SS	These Components must start at the same time
<b>Gap</b>		Attribute to indicate the separation, if any, between the state of the first Interval and the state of the second. Expressed as a duration.

321 WS-Calendar specifies more elements in the Relationship to accommodate the needs of Temporal  
322 Relationships. WS-Calendar also extends iCalendar relationship to allow references to external  
323 Components as well as to those internal to the iCalendar object.

324

Table 3-4: Elements of a WS-Calendar Temporal Relationship

Relationship Element		Definition
<b>Type</b>	String, Mandatory	Enumerated list from union of iCalendar and WS-Calendar Temporal Relationships.
<b>Reference</b>	xcal:uid or xpointer	Identifier of Component in Components collection (if uid) or to external interval (if xpointer).
<b>Gap</b>	xcal:duration <i>Optional</i>	Attribute to indicate the separation, if any, between the state of the first Interval and the state of the second. Expressed as a duration. Only used with Temporal Relationships

325 The relationship below indicates that this Interval is to start ten minutes following the finish of the interval  
326 specified.

327

Example 2: Temporal Relationship

328  
329  
330  
331  
332  
333  
334  
335  
336  
337  
338

```
<x-wscalendarrelation>
<temporalrelationshipstype>finishtostart</temporalrelationshipstype>
<gap>
  <duration>
    <xcal:duration>T00:10</xcal:duration>
  </duration>
</gap>
<relatedto>
  <uid>00959BC664CA650E933C892C@example.com</uid>
</relatedto>
</x-wscalendarrelation>
```

339 If there is no temporal separation between Intervals, the gap element is optional. The following examples  
340 are equivalent expressions to express a relationship wherein both intervals must start at the same  
341 moment.

342

*Example 3: Temporal Relationship with and without Gap*

```

343 <x-wscalendarrelation>
344 <temporalrelationshiptype>starttostart</temporalrelationshiptype>
345 <gap>
346   <duration>
347     <xcal:duration>T00:10</xcal:duration>
348   </duration>
349 </gap>
350 <relatedto>
351   <uid>00959BC664CA650E933C892C@example.com</uid>
352 </relatedto>
353 </x-wscalendarrelation>

```

354 Leaving out the optional Gap element, we have:

```

355 <x-wscalendarrelation>
356 <temporalrelationshiptype>starttostart</temporalrelationshiptype>
357 <relatedto>
358   <uid>00959BC664CA650E933C892C@example.com</uid>
359 </relatedto>
360 </x-wscalendarrelation>

```

361 The two expressions of a Temporal Relationship above are equivalent.

362 Intervals with Temporal Relationships enable the message to express complex temporal relations within a  
363 Sequence, as well as express the simple consecutive intervals named a Partition

364 As the rules for parsing XML do not mandate preservation of order within a sub-set, we cannot assume  
365 that order is preserved when parsing a set of Components. For Sequences, mere order is not enough—  
366 each Interval must either refer to or be referred by at least one interval. Either way, a Sequence defines a  
367 coherent set of intervals that can be assembled out of members of a collection of intervals

### 368 3.4 Sequences: Combining Intervals

369 Section 3.3 introduced Temporal Relationships. A collection of intervals with a coherent set of Temporal  
370 Relationships is a Sequence. Temporal Relationships are transitive, so that if Interval A is related to  
371 Interval B, and Interval B is related to Interval C, then Interval A is related to Interval C.

372 *Table 3-5: Introducing the Sequence*

```

373 <components>
374 <vtodo>
375   <properties>
376     <x-wscalendartype>Interval</x-wscalendartype>
377     <xcal:uid>
378       <xcal:text>10959BC664CA650E933C892C@example.com</xcal:text>
379     </xcal:uid>

408         </relatedto>
409     </x-wscalendarrelation>
410 </properties>
411 </vtodo>
412 <vtodo>
413     <properties>
414         <x-wscalendartype>Interval</x-wscalendartype>
415         <xcal:uid>
416             <xcal:text>30959BC664CA650E933C892C@example.com</xcal:text>
417         </xcal:uid>
418         <xcal:description>
419             <xcal:text>Third Interval in Sequence</xcal:text>
420         </xcal:description>
421         <xcal:duration>
422             <xcal:duration>T30M</xcal:duration>
423         </xcal:duration>
424         <x-wscalendarrelation>
425             <temporalrelationshiptype>finishtostart</temporalrelationshiptype>
426             <relatedto>
427                 <uid>20959BC664CA650E933C892C@example.com</uid>
428             </relatedto>
429             <gap>
430                 <xcal:duration>
431                     <xcal:duration>T10M</xcal:duration>
432                 </xcal:duration>
433             </gap>
434         </x-wscalendarrelation>
435     </properties>
436 </vtodo>
437 </components>

```

438 In this example, the Intervals are one hour, 15 minutes, and 30 minutes long. There is a ten minute period  
439 between the second and third periods.

### 440 3.4.1 Scheduling a Sequence

441 A Sequence becomes a Scheduled Sequence whenever single interval within the sequence is scheduled.  
442 An interval is scheduled when it has a specific starting time (dtstart).

443 *Example 4: A Scheduled Sequence*

```

444 <components>
445 <vtodo>
446     <properties>
447         <x-wscalendartype>Interval</x-wscalendartype>
448         <xcal:uid>
449             <xcal:text>10959BC664CA650E933C892C@example.com</xcal:text>
450         </xcal:uid>
451         <xcal:description>
452             <xcal:text>First Interval in Sequence</xcal:text>
453         </xcal:description>
454         <dtstart>2010-09-11T13:00</dtstart>
455         <xcal:duration>

```

```

456         <xcal:duration>T1H</xcal:duration>
457     </xcal:duration>
458 </properties>
459 </vtodo>
460 <vtodo>
461     <properties>
462         <x-wscalendartype>Interval</x-wscalendartype>
463         <xcal:uid>
464             <xcal:text>20959BC664CA650E933C892C@example.com</xcal:text>
465         </xcal:uid>
466         <xcal:description>
467             <xcal:text>Second Interval in Sequence</xcal:text>
468         </xcal:description>
469         <xcal:duration>
470             <xcal:duration>T15M</xcal:duration>
471         </xcal:duration>
472         <x-wscalendarrelation>
473             <temporalrelationshipstype>finishtostart</temporalrelationshipstype>
474             <relatedto>
475                 <uid>10959BC664CA650E933C892C@example.com</uid>
476             </relatedto>
477         </x-wscalendarrelation>
478     </properties>
479 </vtodo>
480 </components>

```

481 Note that the entire Sequence is scheduled when a single Interval within the Sequence is scheduled.

### 482 3.5 Alarms

483 Alarms in WS-Calendar declare when to send notifications between services. Within a single service,  
484 alarms declare milestones and target times. The base iCalendar object for all alarms is the VALARM  
485 object. This section discusses how the iCalendar VALARM object is used in WS-Calendar.

486 The use of Alarms in enterprise scheduling is a rapidly changing area as this is written, and alarm  
487 mechanisms are out of scope for this document. An Alarm notifies another party that something has  
488 happened or is about to happen. Some alarms, such as alarm clocks, are scheduled explicitly. Others  
489 arise as a notification from another system. WS-Eventing, oBIX alarms, and CAP and EDXL alerts are  
490 just a few of the already defined mechanisms.

491 In WS-Calendar, an alarm is a VALARM object within an Interval object, Its actions are [XPOINTER]  
492 references to the service or event that is triggered. Valarm also supports recurring activities. A long-  
493 running Interval service could include a recurring call-out to a 3<sup>rd</sup> service providing observation of the  
494 service's effects. For example, a Demand Response service could be launched accompanied by a  
495 recurring 5 minute request to read the meter from another service.

### 496 3.6 Time Stamps

497 Time stamps are used everywhere in inter-domain service performance analysis and have particular use  
498 in smart grids to support event forensics. Time stamps are often assembled and collated from events  
499 across multiple time zones and from multiple systems.

500 Different systems may track time and therefore record events with different levels of Tolerance. It is not  
501 unusual for a time stamp from a domain with a low Tolerance to appear to have occurred after events  
502 from a domain with high-Tolerance time-stamps that it caused. A fully qualified time-stamp includes the  
503 granularity measure.

504 *Table 3-6: Aspects of Time Stamps*

Time Stamp Element	Definition (Normative)	Note (Non-Normative)
--------------------	---------------------------	-------------------------

Time Stamp Element	Definition (Normative)	Note (Non-Normative)
<b>timestamp</b>	WS-Calendar:time A fully qualified date and time of event. Mandatory.	May include two objects as defined above.
<b>precision</b>	A Duration defining the accuracy of the TimeStamp value. Mandatory.	Identifies whether one hour interval is indeed one hour or plus or minus some number of milliseconds, seconds and minutes.
<b>timeStampRealm</b>	Of type Uri, shall identify the system where the TimeStamp value originated. The value of this element shall be set by: <ul style="list-style-type: none"> <li>• The component at the realm border in a particular inter-domain interaction or,</li> <li>• By any component able to accurately set it within a system or sub-system.</li> </ul> In the latter case, nothing prevents the component at the realm border to overwrite it without any notice. Optional.	A set of points originating from the same realm are reasonably synchronized. Within a realm, one can assume that time-stamped objects sorted by time are in the order of their occurrence. Between realms, this assumption is rebuttable. A system border is crossed in an interaction when the 2 communication partners are not synchronized based on the same time source. See the example below for more information.
<b>leapSecondsKnown</b>	Xs:bool If True, shall indicate that the TimeStamp value takes into account all leap seconds occurred. Otherwise False. Optional.	Indicates that the time source of the sending device support leap seconds adjustments.
<b>clockFailure</b>	xs:bool If True, shall indicate a failure on the time source preventing the TimeStamp value issuer from setting accurate timestamps. Otherwise False. Mandatory.	Indicates that the time source of the sending device is unreliable. The timestamp should be ignored.
<b>clockNotSynchronized</b>	xs:bool If True, shall indicate the time source of the TimeStamp value issuer is not synchronized correctly, putting in doubt the accuracy of the timestamp. Mandatory.	Indicates that the time source of the sending device is not synchronized with the external UTC time source.

Time Stamp Element	Definition (Normative)	Note (Non-Normative)
<b>timeSourceAccuracy</b>	A Duration defining the accuracy of the time source used in the TimeStampRealm system. Optional.	Represents the time accuracy class of the time source of the sending device relative to the external UTC time source.

505 **3.6.1 Time Stamp Realm Discussion**

506 Within a single system, or synchronized system of systems, one can sort the temporal order of event by  
507 sorting them by TimeStamp. Determining the order of events is the first step of event forensics. This  
508 assumption does not apply when events are gathered across systems.

509 Different systems may not have synchronized time, or may synchronize time against different sources.  
510 This means different system clocks may drift apart. It may be that a later timestamp from one system  
511 occurred before an earlier timestamp in another. As this drift is unknown, it cannot be automatically  
512 corrected for without additional information.

513 The TimeStampRealm element identifies which system created an event time-stamp. The  
514 TimeStampRealm identifies a source system in inter-domain interactions (a system of systems). For  
515 example: <http://SystemA.com> and <http://SystemB.com> identify 2 systems. This example assumes  
516 SystemA and SystemB do not have a common time source.

517 The TimeStampRealm can also be used to identify sub-systems in intra-domain interactions (sub-systems  
518 of a system). For For example: <http://SystemA.com/SubSystem1> and <http://SystemA.com/SubSystem2>  
519 identify 2 subsystems of the same higher level system. In case the upper level SystemA does not have a  
520 global time source for synchronizing all of its sub-system, it can be useful to identify sub-systems in such  
521 a way.

## 4 Service Characteristics: Attachments & Performance

### 4.1 Services and Service Characteristics

While iCalendar expresses time and intervals, WS-Calendar associates those intervals with specific services and service characteristics. WS-Calendar uses the ATTACH element that is already part of each iCalendar components to specify services and performance characteristics.

In iCalendar, the ATTACH element carries unstructured information associated with the event or alarm communication. Attachments in iCalendar can also be in the form of URIs pointing outside the iCalendar structure. WS-Calendar uses structured XML to communicate service intents.

#### 4.1.1 Attachments

The XML artifact in the attachment may be in-line, i.e., contained within the ATTACH element of the VTODO or VALARM object, or it may be found in another section of the same XML object, sharing the same message as WS-Calendar element, or it may be discovered by external reference. Attachments, then, are used to request “perform as described here”, or “perform as described below”, or “perform as described elsewhere.”

The ATTACH element in WS-Calendar has three elements as below.

Table 4-1: Elements of a WS-Calendar Attachment

Attachment Element	Use	Discussion
<b>artifact</b>	any in-line XML (xs:any). <i>Optional.</i> An attachment must have at least one artifact or reference	Defined per the business process associated with this interaction. WS-Calendar. This is not an object, it is merely a name for use in documentation An attachment must have at least one of
<b>reference</b>	[XPOINTER] <i>Optional</i> An attachment must have at least one of artifact or reference	Points to external XML, or XML located elsewhere in document
<b>performance</b>	WsCalendar:Performance <i>Optional</i>	Specifies time-related performance characteristics.

When a WS-Calendar reference uses an external reference to specify a service, that reference is an object of the type [XPOINTER] (see section 1.2)..[XPOINTER] is a general purpose URI and XML traversal standard. This [XPOINTER] object is in the named data element “Reference.”

Example 5: Use of an Attachment with inline XML artifact

```

<vtodo>
  <properties>
    <x-wscalendartype>Interval</x-wscalendartype>
    <xcal:uid>
      <xcal:text>00959BC664CA650E933C892C@example.com</xcal:text>
    </xcal:uid>
    <xcal:description>
      <xcal:text>Sample Contract</xcal:text></xcal:description>
    <attach>
      <artifact>

```

```

553         <emix-wip>
554             <price>8.45</price>
555             <quantity>8.45</quantity>
556         </emix-wip>
557         <artifact/>
558     </attach>
559 </properties>
560 </vtodo>

```

561 Note: as this is written, there is no EMIX specification. The Artifact is of type xs:any, allowing compliant  
562 XML from any namespace to be used.

563 *Example 6: Use of an Attachment with external reference*

```

564 <vtodo>
565     <properties>
566         <x-wscalendartype>Interval</x-wscalendartype>
567         <xcal:uid>
568             <xcal:text>00959BC664CA650E933C892C@example.com</xcal:text>
569         </xcal:uid>
570         <xcal:description>
571             <xcal:text>Sample Contract</xcal:text></xcal:description>
572         <attach>
573             <reference>http://scheduled.ws-calendar-
574                 service.com/contract1</reference>
575         </attach>
576     </properties>
577 </vtodo>

```

578

## 579 4.1.2 Specifying Timely Performance

580 Service coordination between systems requires precise communication about expectation for the  
581 timeliness of performance. These expectations can be set for each interval or for an entire sequence.  
582 This communication is through the performance component of the Attachment.

583 The Performance component refines the meaning of time-related service communication. All elements of  
584 the Performance object use the Duration element as defined in [RFC5545].

585 *Table 4-2: Performance Characteristics*

Performance Characteristic	Definition	Discussion
<b>startBeforeTolerance</b>	A Duration enumerating how far before the requested start time the requested service may commence.	Indicates if a service that begins at 1:57 is compliant with a request to start at 2:00
<b>startAfterTolerance</b>	A Duration enumerating how far after the requested start time the requested service may commence.	Indicates if a service that begins at 2:01 is compliant with a request to start at 2:00
<b>endBeforeTolerance</b>	A Duration enumerating how far before scheduled end time may end.	Indicates if a service that ends at 1:57 is compliant with a request to end at 2:00
<b>endAfterTolerance</b>	A Duration enumerating how far after the scheduled end time the requested service may commence.	Indicates if a service that ends at 2:01 is compliant with a request to end at 2:00

Performance Characteristic	Definition	Discussion
<b>durationLongTolerance</b>	A Duration indicating by how much the performance duration may exceed the duration specified in the Interval . It may be 0.	Used when run time is more important than start and stop time. DurationLongTolerance SHALL NOT be used when Start and End Tolerances are both specified.
<b>durationShortTolerance</b>	A Duration indicating by how much the performance duration may fall short of duration specified in the Interval . It may be 0.	Used when run time is more important than start and stop time. DurationShortTolerance SHALL NOT be used when Start and End Tolerances are both specified.
<b>granularity</b>	A Duration enumerating the smallest unit of time measured or tracked	Whatever the time tolerance above, there is some minimum time that is considered insignificant. A Granularity of 1 second defines the tracking and reporting requirements for a service.

586 Performance is part of the core WS-Calendar service definition. Similar products or services, identical  
587 except for different Performance characteristics may appear in different markets. Performance  
588 characteristics influence the price offered and the service selected.

589 Note that Performance object does not indicate time, but only duration. A performance object associated  
590 with an unscheduled Interval does not change when that Interval is scheduled.

591 The Performance object is an optional component of each WS-Calendar attachment.

592 *Example 7: Performance Component*

```

593 <attach>
594   <uri>http://scheduled.ws-calendar-service.com/contract1</uri>
595   <performance>
596     <properties>
597       <startbeforetolerance>
598         <duration>
599           <duration>T10M</duration>
600         </duration>
601       </startbeforetolerance>
602       <startaftertolerance>
603         <duration>
604           <duration>T0M</duration>
605         </duration>
606       </startaftertolerance>
607       <durationlongtolerance>
608         <duration>
609           <duration>T0M</duration>
610         </duration>
611       </durationlongtolerance>
612       <durationshorttolerance>
613         <duration>
614           <duration>T0M</duration>
615         </duration>
616       </durationshorttolerance>
617     </properties>
618   </performance>
619 </attach>

```

620 In the example, the service can start as much as 10 minutes earlier than the scheduled time, and must  
621 start no later than the scheduled time. Whenever the service starts, it the service must execute for exactly  
622 the duration indicated.

623 Generally, the implementer should refrain from expressing unnecessary or redundant performance  
624 characteristics.

### 625 4.1.3 Combining Service and Performance

626 Services, references and performance each appear in the ATTACH element of the iCalendar  
627 components.

628 *Example 8: Interval with inline XML artifact and optional specified Performance*

```
629 <vtodo>  
630   <properties>  
631     <x-wscalendartype>Interval</x-wscalendartype>  
632     <xcal:uid>  
633       <xcal:text>00959BC664CA650E933C892C@example.com</xcal:text>  
634     </xcal:uid>  
635     <xcal:description>  
636     <xcal:text>Sample Contract</xcal:text></xcal:description>  
637     <attach>  
638       <artifact>  
639         <emix-wip>  
640           <price>8.45</price>  
641           <quantity>8.45</quantityprice>  
642         </emix-wip>  
643       </artifact/>  
644       <performance>  
645         <properties>  
646           <startbeforetolerance>  
647             <duration>  
648               <duration>T10M</duration>  
649             </duration>  
650           </startbeforetolerance>  
651           <startaftertolerance>  
652             <duration>  
653               <duration>T0M</duration>  
654             </duration>  
655           </startaftertolerance>  
656         </properties>  
657       </performance>  
658     </attach>  
659   </properties>  
660 </vtodo>
```

661 *Example 9: Interval with external reference and optional specified performance*

```
662 <vtodo>  
663   <properties>  
664     <x-wscalendartype>Interval</x-wscalendartype>  
665     <xcal:uid>  
666       <xcal:text>00959BC664CA650E933C892C@example.com</xcal:text>  
667     </xcal:uid>  
668     <xcal:description>  
669     <xcal:text>Sample Contract</xcal:text></xcal:description>  
670     <attach>  
671       <reference>http://scheduled.ws-calendar-  
672         service.com/contract1</reference>  
673     </performance>  
674     <properties>  
675       <startbeforetolerance>  
676         <duration>  
677           <duration>T10M</duration>  
678         </duration>  
679       </startbeforetolerance>  
680       <startaftertolerance>
```

```
681         <duration>
682             <duration>T0M</duration>
683         </duration>
684     </startaftertolerance>
685     </properties>
686 </performance>
687 </attach>
688 </properties>
689 </vtodo>
```

690

## 5 Inheritance and Entry Points: Calendar Gluons

691

### 5.1.1 Calendar Gluons

692

693

694

695

696

697

698

699

WS-Calendar introduces a new iCalendar component, the Calendar Gluon. In physics, Gluons act to mediate as well as to participate in the interactions between quarks. A Calendar Gluon defines information to be inherited by each Interval in the Sequence, as well as scheduling the entire sequence. A Calendar Gluon is essentially the Interval component profiled down to minimal elements for which inheritance rules are then defined for the sequence. (See Appendix *Overview of WS-Calendar, its Antecedents and its Use*) Calendar Gluons use iCalendar relations to apply service information to Sequences.

Table 5-1: Calendar Gluon elements in WS-Calendar

Calendar Gluon Element	Use	Discussion
<b>x-wscalendarType</b>	Mandatory xs:string, value always "CalendarGluon"	Added vtodo attribute, ignored by iCalendar processors
<b>dtStamp</b>	[XCAL]:dtstamp <i>Mandatory</i>	Time and date that Calendar Gluon object was created
<b>uid</b>	<i>Mandatory</i>	Used to enable unambiguous referencing of each VTODO object
<b>summary</b>	Text' <i>Optional</i>	Text describing the Calendar Gluon
<b>related</b>	WsCalendar:Relationship <i>Mandatory</i>	A Calendar Gluon must have a relationship with at least one other component. The only relationship defined for the Calendar Gluon is the IsParent.
<b>dtStart</b>	[XCAL]:Time. Start time for the related interval of the sequence. <i>Optional</i>	An Calendar Gluon may either have a dtStart or a dtEnd, but may not have both.
<b>dtEnd</b>	[XCAL]:Time. Scheduled completion time for the related interval of the sequence. <i>Optional</i>	An Calendar Gluon may either have a dtStart or a dtEnd, but may not have both.
<b>duration</b>	[XCAL]:Duration <i>Optional</i>	If specified, a duration is inherited by all intervals in the referred-to sequence,
<b>attach</b>	WSCalendar:Attachment Mandatory Multipleoccurs	Contains WS-Calendar:attachment attribute defining service and performance. Can be inherited by all intervals in sequence.

700 Because the properties of Calendar Gluon properties are inherited by the child Sequence, they can serve  
701 as the elements in any Interval in the Sequence. An inherited element can even serve as a substitute for  
702 an Interval mandatory element. For example, Duration is mandatory for all Intervals. A Duration  
703 expressed in a Calendar Gluon is inherited by each Interval in the associated Sequence. This makes  
704 Intervals without internal Duration compliant, because the Interval inherits the Duration from the Calendar  
705 Gluon. If an Interval in the associated Sequence does include a Duration, that value overrides the value  
706 from the Calendar Gluon.

## 707 5.1.2 Calendar Gluons and Sequences

708 The Calendar Gluon is used to define common service requirements for an entire sequence. If a  
709 RelatedComponent has a parent relationship with the an Interval in a sequence, then the  
710 RelatedComponent's Attachment defines service attributes by all Intervals in the Sequence.

711 In this example, the Sequence in the previous example is expressed using an Calendar Gluon.

712 *Example 10: Sequence with Performance defined in the Calendar Gluon*

```
713 <components>
714 <x- calendargluon>
715   <properties>
716     <x-wscaledartype>CalendarGluon</x-wscaledartype>

849 </vtodo>
850 </components>

```

851 Note that the performance expectations, identical for each interval, have moved into the Calendar Gluon.  
852 Not also that while the duration for all intervals in the partition is set in the Calendar Gluon, interval 3  
853 overrides that with a half hour duration assigned locally. The Calendar Gluon happens to related to the  
854 first Interval in the sequence; there are specific use cases (discussed below) which require it to be linked  
855 to other Intervals.

### 856 5.1.3 Inheritance rules for Calendar Gluons

857 In general, the rules that anything specified in the Parent Calendar Gluon applies to each Child. The  
858 Parent of an Interval in a Sequence is parent to all Intervals in the Sequence. As a Sequence creates  
859 single temporal relationship, assigning a start time (dstart) to any Interval allows the starting time to be  
860 computed for any of them.

861 *Table 5-2 Gluon Inheritance rules*

Attribute	Inheritance Rules
<b>General</b>	A Interval or Calendar Gluon inherits its attributes through it's the closest parent. Local specification of an attributes overrides any inheritance.
<b>Duration</b>	Follows general rules
<b>Temporal Relation</b>	Relationship Type and Gap only are inherited. Either may be overridden locally. To specify no gap when a parent specifies a gap, an explicit zero duration gap must be specified. Related-to is not inherited.
<b>Performance</b>	Performance is either inherited intact or overridden completely. There are no rules for recombining partial Performance objects through inheritance..

Attribute	Inheritance Rules
<b>Artifacts</b>	Artifacts are combined within their respective namespaces, and are evaluated for completeness after Artifact inheritance. Referring specifications should detail any conformance requirements.
<b>Schedules</b>	In general, schedule dates are inherited as if they consisted of a separate Date and a Time. The Date and the Time are evaluated separately. Thus a child may specify a Date on which it is willing to have a Time scheduled, or a Time at which it is willing to perform a service on any requested Date. If a parent specifies both, and a child specifies one, the paired elements (parent-time:child-time or parent-date:child-date) must match.

#### 862 5.1.4 Optimizing the expression of a Partition

863 Partitions are Sequences with consecutive Intervals. Communication of a Partition can be further  
864 optimized by bringing the relationship into the Calendar Gluon. Notice that while the type of the  
865 relationship is defined in the Calendar Gluon, the Temporal Relation for each Interval must still be  
866 expressed within the Interval.

867 *Example 11: Partition with Duration and Performance defined in the Calendar Gluon*

```

868 <components>
869 <x--calendargluon>

```

995 This Partition shows a school schedule in which classes start one hour apart. Each service is performed  
996 for 50 minutes, and there is a 10 minute gap between each as students move between classes. Classes  
997 may not begin before the schedule, but they may start up to five minutes late.

998 Stripped of all annotations, this can be expressed as follows:

999 *Example 12: Partition without annotations*

```

1000 <components>
1001 <x-calendargluon>

## 1140 5.1.5 Mixed Inheritance of Start Time

1141 A Sequence has not been scheduled until it has both a start time and a start date. Start time and date  
1142 SHALL be expressed together when all components are in a single communication. Time and Date MAY  
1143 be separated when the full sequence and schedule are created by reference.

1144 To illustrate this, here is the classroom scheduling Partition from Example 12, updated to include each  
1145 day's school opening.

1146 *Example 14: Partition with Duration and Performance defined in the Calendar Gluon*

```

1147 <components>
1148 <x-calendargluon>
1149     <properties>
1150         <x-wscalendartype>CalendarGluon</x-wscalendartype>

```

```

1151     <xcal:uid>
1152         <xcal:text>
1153             90959BC664CA650E933C892C@invokingexample.com
1154         </xcal:text>
1155     </xcal:uid>
1156     <dtstart>2010-09-13T09:00</dtstart>
1157     <xcal:related-to>
1158         <xcal:parameters>
1159             <xcal:reltype>PARENT</xcal:reltype>
1160         </xcal:parameters>
1161         <xcal:uri>http://scheduled.ws-calendar-service.com/classSchedule
1162         </xcal:uri>
1163     </xcal:related-to>
1164 </properties>
1165 </x-calendargluon>
1166 </components>

```

1167 Here, an external Calendar Gluon (above) makes reference to a published classroom schedule service:

```

1168 <x-calendargluon>
1169     <properties>
1170         <x-wscalendartype>CalendarGluon</x-wscalendartype>
1171         <xcal:uid>
1172             <xcal:text>http://scheduled.ws-calendar-service.com/classSchedule
1173             </xcal:text>

1257

```

1258 In the example above, a general purpose classroom calendar has been created and advertised with an  
1259 URL. The class day always starts at 9:00. The referring Calendar Gluon scheduled a particular instance  
1260 of this Sequence for Monday, September 13.

1261 This double inheritance, in which a Sequence inherits from a Calendar Gluon which inherits from a  
1262 Calendar Gluon is a useful pattern for scheduling an advertised service.

## 1263 5.1.6 Other Scheduling Scenarios

1264 Sometimes, the invoker of a service is interested only in single Interval of the Sequence, but the entire  
1265 Sequence is required. In the example below, the second Interval is advertised, i.e., the Calendar Gluon  
1266 points to the second Interval. The first interval might be a required ramp-period, during which the  
1267 underlying process is “warming up”, and which may bring some lesser service to market during that ramp  
1268 time. The ramp-down time at the end is similarly fixed. The entire Service offering is represented by the  
1269 exposed (it has a public URI) Calendar Gluon.

1270

*Example 15: Standard Sequence with Ramp-Up and Ramp Down*

1416 </components>

```

1417 In this case, the specific interval is scheduled and a run time of 6 hours is specified for a price of \$15,000.

---

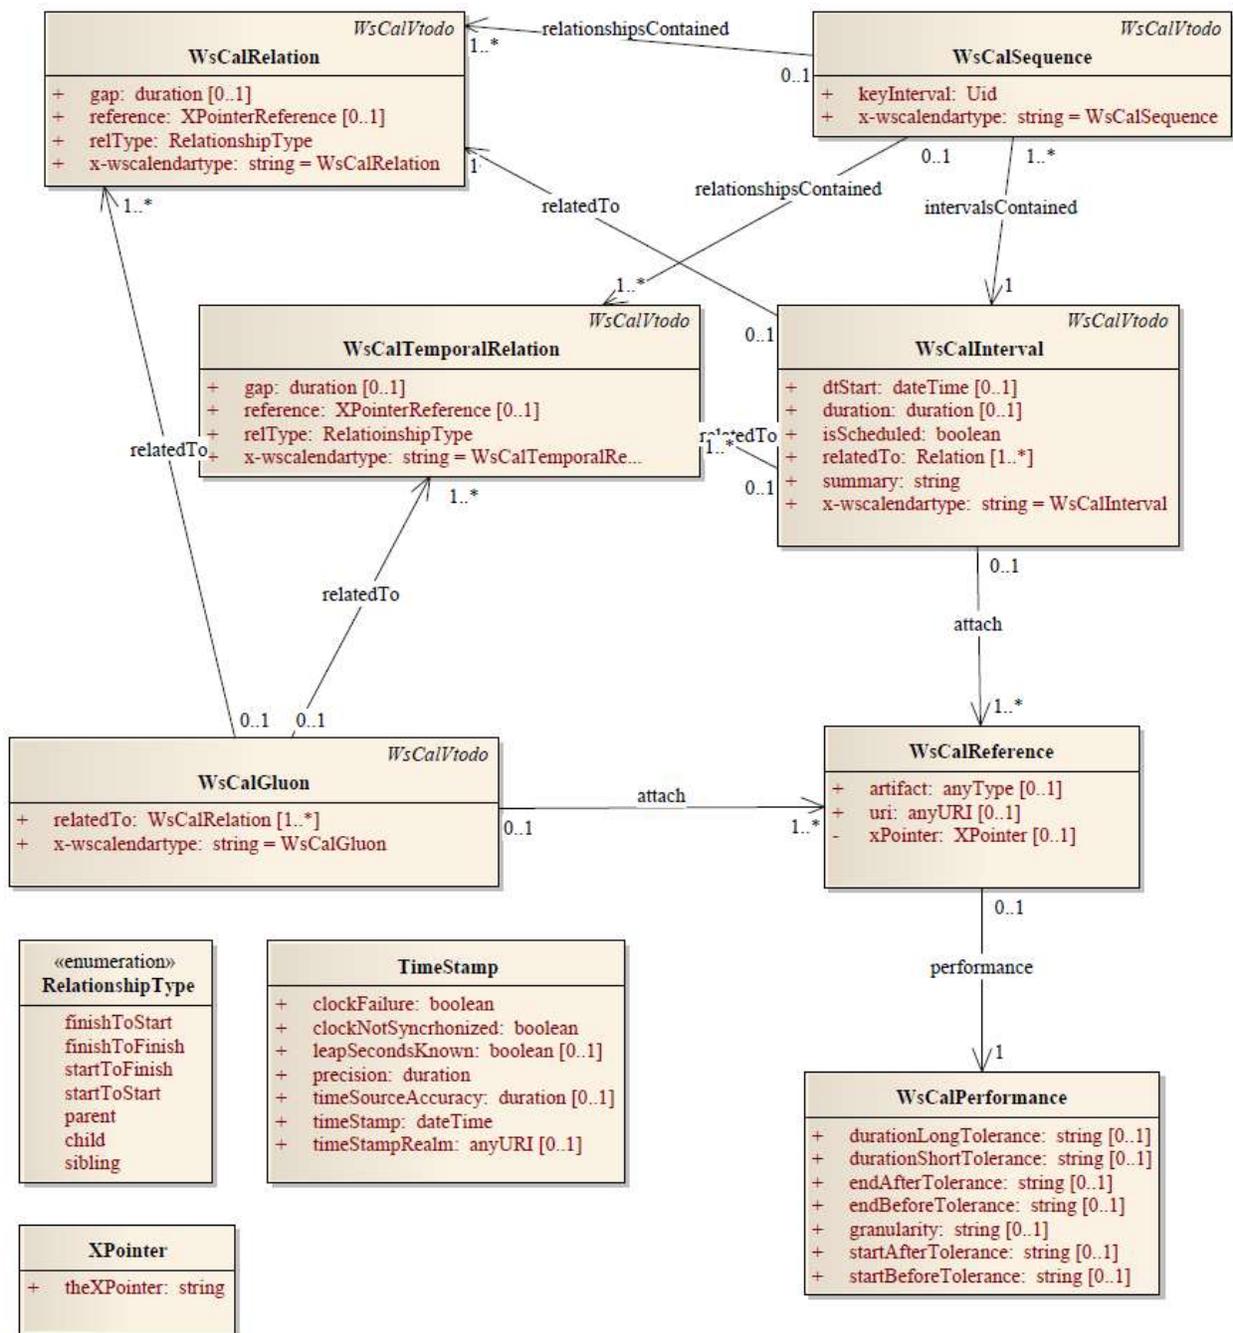

<sup>5</sup> There is no EMIX-WIP specification. EMIX-WIP represents a generic energy market artifact, perhaps evocative of future specifications.

1418

## 6 WS-Calendar Models

1419

### 6.1 Abstract model for WS-Calendar Objects

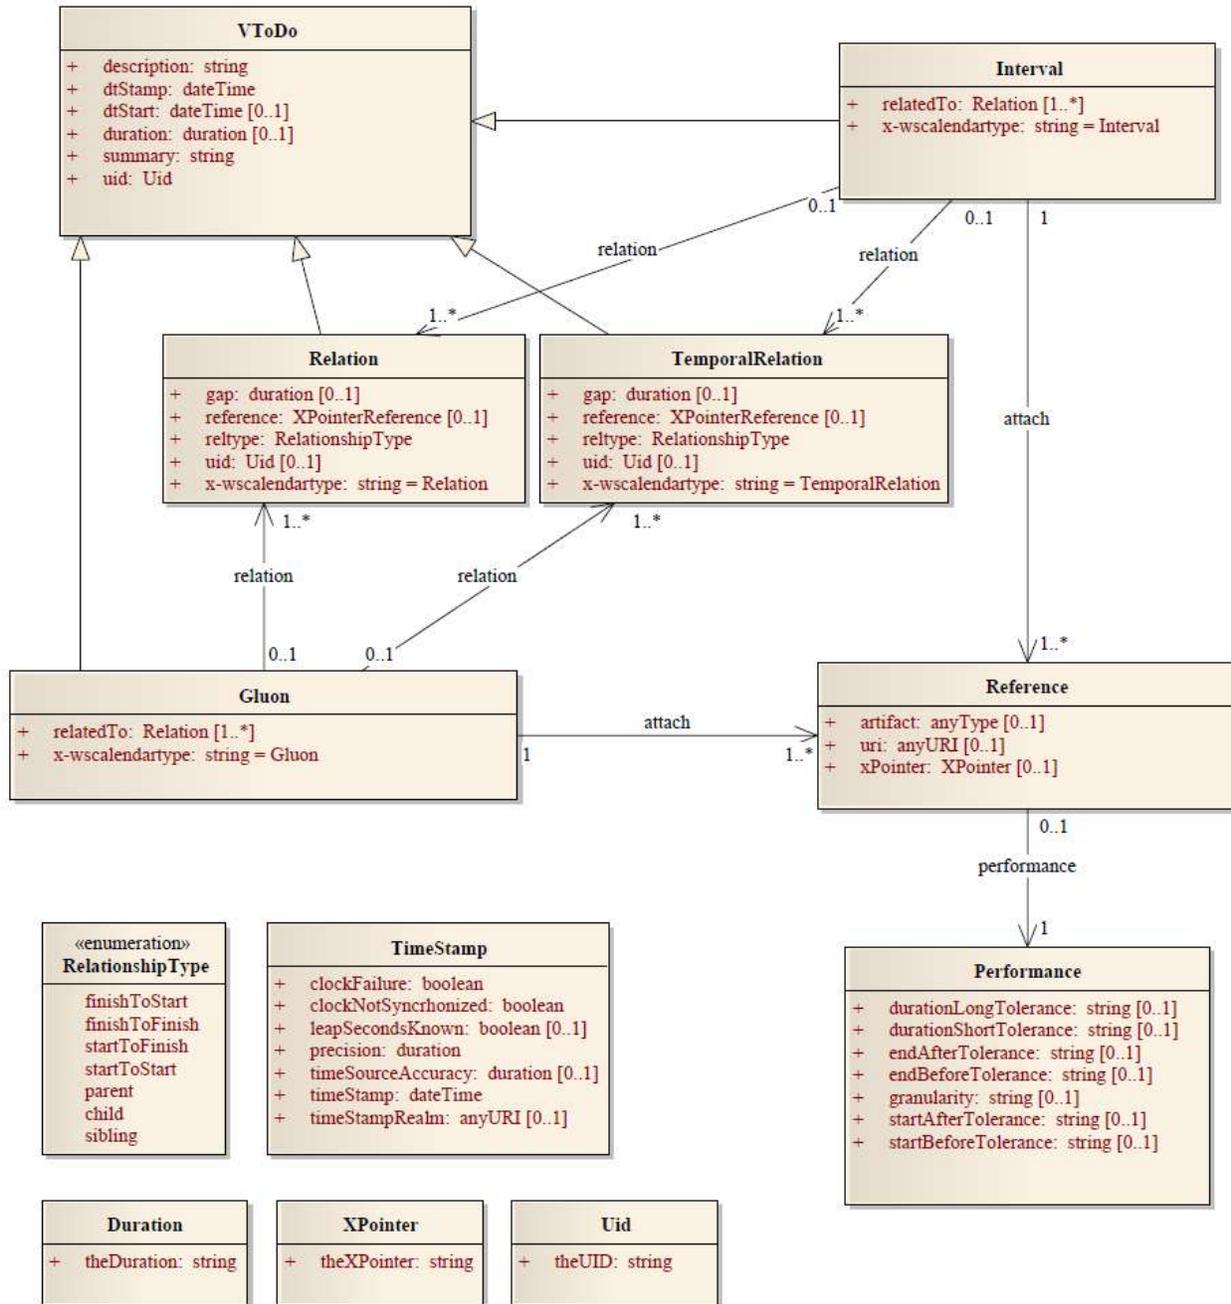

1420

1421

1422

Figure 1: Abstract UML Model

## 6.2 Implementation Model for WS-Calendar

1424

1425

Figure 2: Implementation Model for WS-Calendar

---

## 1426 7 Calendar Services

1427 The Service interactions are built upon and make the same assumptions about structure as the CalDAV  
1428 protocol defined in **[RFC4791]** and related specifications. It does NOT require nor assume the WebDAV  
1429 nor CalDAV protocol but does make use of some of the same elements and structures in the CalDAV  
1430 XML namespace.

1431 Calendar resources, for example events and tasks are stored as named resources (files) inside special  
1432 collections (folders) known as "**Calendar Collections**".

1433 These services can be looked upon as a layer built on top of CalDAV and defines the basic operations  
1434 which allow creation, retrieval, update and deletion. In addition, query, and free-busy operations are  
1435 defined to allow efficient, partial retrieval of calendar data.

1436 These services assume a degree of conformity with CalDAV is established such that services built in that  
1437 manner do not have a significant mismatch. It is assumed that some WS-Calendar services will be built  
1438 without any CalDAV support.

### 1439 7.1 Overview of the protocol

1440 The protocol is an HTTP based RESTfull protocol using a limited set of methods. Each request may be  
1441 followed by a response containing status information.

1442 The following methods are specified in the protocol description, PUT, POST, GET, DELETE. To avoid  
1443 various issues with certain methods being blocked clients may use the X-HTTP-Method-Override: header  
1444 to specify the intended operation. Servers SHOULD behave as if the named method was used.

```
1445     POST /user/fred/calendar/ HTTP/1.1  
1446     ...  
1447     X-HTTP-Method-Override: PUT  
1448     Properties
```

1449 A service or resource will have a number of properties which describe the current state of that service or  
1450 resource. These properties are accessed through a GET on the target resource or service with an  
1451 ACCEPT header specifying application/xrd+xml. See Section 7.1.3.6

1452 The following operations are defined by this specification:

- 1453 • Retrieval and update of service and resource properties
- 1454 • Creation of a calendar object
- 1455 • Retrieval of a calendar object
- 1456 • Update of a calendar object
- 1457 • Deletion of a calendar object
- 1458 • Query
- 1459 • Free-busy query

#### 1460 7.1.1 Calendar Object Resources

1461 The same restrictions apply to Calendar Object Resources as specified in CalDAV **[RFC4791]** section  
1462 4.2. An additional constraint for CalWS is that no timezone specifications are transferred.

#### 1463 7.1.2 Timezone information

1464 It is assumed that the client and server each have access to a full set of up to date timezone information.  
1465 Timezones will be referenced by a timezone identifier from the full set of Olson data together with a set of  
1466 well-known aliases defined **[TZDB]**. CalWS services may advertise themselves as timezone servers  
1467 through the server properties object.

1468 **7.1.3 Issues not addressed by this specification.**

1469 A number of issues are not addressed by this version of the specification, either because they should be  
1470 addressed elsewhere or will be addressed at some later date.

1471 **7.1.3.1 Access Control**

1472 It is assumed that the targeted server will set an appropriate level of access based on authentication. This  
1473 specification will not attempt to address the issues of sharing or Access Control Lists (ACLs).

1474 **7.1.3.2 Provisioning**

1475 The protocol will not provide any explicit provisioning operations. If it is possible to authenticate or  
1476 address a principals calendar resources then they **MUST** be automatically created if necessary or  
1477 appropriate

1478 **7.1.3.3 Copy/Move**

1479 These operations are not yet defined for this version of the CalWS protocol. Both operations raise a  
1480 number of issues. In particular implementing a move operation through a series of retrievals, insertions  
1481 and deletions may cause undesirable side-effects. Both these operations will be defined in a later version  
1482 of this specification.

1483 **7.1.3.4 Creating Collections**

1484 We will not address the issue of creating collections within the address space. The initial set is created by  
1485 provisioning.

1486 **7.1.3.5 Retrieving collections**

1487 This operation is currently undefined. A GET on a collection may fail or return a complete calendar object  
1488 representing the collection.

1489 **7.1.3.6 Setting service and resource properties.**

1490 These operations are not defined in this version of the specification. In the future it will be possible to  
1491 define or set the properties for the service or resources within the service.

1492 **7.1.4 CalWS Glossary**

1493 **7.1.4.1 Hrefs**

1494 An href is a URI reference to a resource, for example

1495 `"http://example.org/user/fred/calendar/event1.ics".`

1496 The URL above reflects a possible structure for a calendar server. All URLs should be absolute or path-  
1497 absolute following the rules defined in **RFC4918** Section 8.3.

1498 **7.1.4.2 Calendar Object Resource**

1499 A calendar object resource is an event, meeting or a task. Attachments are resources but **NOT** calendar  
1500 object resources. An event or task with overrides is a single calendar resource entity.

1501 **7.1.4.3 Calendar Collection**

1502 A folder only allowed to contain calendar object resources.

#### 1503 7.1.4.4 Scheduling Calendar Collection

1504 A folder only allowed to contain calendar resources which is also used for scheduling operations.  
1505 Scheduling events placed in such a collection will trigger implicit scheduling activity on the server.

#### 1506 7.1.4.5 Principal Home

1507 The collection under which all the resources for a given principal are stored. For example, for principal  
1508 "fred" the principal home might be "/user/fred/"

### 1509 7.2 Error conditions

1510 Each operation on the calendar system has a number of pre-conditions and post-conditions that apply.

1511 A "precondition" for a method describes the state of the server that must be true for that method to be  
1512 performed. A "post-condition" of a method describes the state of the server that must be true after that  
1513 method has been completed. Any violation of these conditions will result in an error response in the form  
1514 of a CalWS XML error element containing the violated condition and an optional description. \

1515 Each method specification defines the preconditions that must be satisfied before the method can  
1516 succeed. A number of post-conditions are generally specified which define the state that must exist after  
1517 the execution of the operation. Preconditions and post-conditions are defined as error elements in the  
1518 CalWS XML namespace.

#### 1519 7.2.1 Example: error with CalDAV error condition

```
1520 <?xml version="1.0" encoding="utf-8"  
1521     xmlns:CW="Error! Reference source not found."  
1522     xmlns:C="urn:ietf:params:xml:ns:caldav" ?>  
1523 <CW:error>  
1524   <C:supported-filter>  
1525     <C:prop-filter name="X-ABC-GUID"/>  
1526   </C:supported-filter>  
1527   <CW:description>Unknown property </CW:description>  
1528 </CW:error>
```

1529

## 8 Properties and link relations

1530

### 8.1 Property and relation-type URIs

1531  
1532  
1533  
1534

In the XRD entity returned properties and related services and entities are defined by absolute URIs which correspond to the extended relation type defined in **[web linking]** Section 4.2. These URIs do NOT correspond to any real entity on the server and clients should not attempt to retrieve any data at that target.

1535  
1536  
1537

Certain of these property URIs correspond to CalDAV preconditions. Each URL is prefixed by the CalWS relations and properties namespace `http://docs.oasis-open.org/ns/wscal/calws`. Those properties which correspond to CalDAV properties have the additional path element "caldav/", for example

1538  
1539

```
http://docs.oasis-open.org/ns/wscal/calws/caldav/supported-calendar-data
```

corresponds to

1540

```
CalDAV:supported-calendar-data
```

1541  
1542

In addition to those CalDAV properties, the CalWS specification defines a number of other properties and link relations with the URI prefix of `http://docs.oasis-open.org/ns/wscal/calws`.

1543

### 8.2 supported-features property.

1544

```
http://docs.oasis-open.org/ns/wscal/calws/supported-features
```

1545  
1546  
1547

This property defines the features supported by the target. All resources contained and managed by the service should return this property. The value is a comma separated list containing one or more of the following

1548

- calendar-access - the service supports all MUST requirements in this specification

1549  
1550

```
<Property type="http://docs.oasis-open.org/ns/wscal/calws/supported-features"  
>calendar-access</Property>
```

1551

### 8.3 max-attendees-per-instance

1552

```
http://docs.oasis-open.org/ns/wscal/calws/max-attendees-per-instance
```

1553

Defines the maximum number of attendees allowed per event or task.

1554

### 8.4 max-date-time

1555

```
http://docs.oasis-open.org/ns/wscal/calws/max-date-time
```

1556

Defines the maximum date/time allowed on an event or task

1557

### 8.5 max-instances

1558

```
http://docs.oasis-open.org/ns/wscal/calws/max-instances
```

1559

Defines the maximum number of instances allowed per event or task

1560

### 8.6 max-resource-size

1561

```
http://docs.oasis-open.org/ns/wscal/calws/max-resource-size
```

1562  
1563

Provides a numeric value indicating the maximum size of a resource in octets that the server is willing to accept when a calendar object resource is stored in a calendar collection.

## 1564 8.7 min-date-time

1565 <http://docs.oasis-open.org/ns/wscal/calws/min-date-time>

1566 Provides a DATE-TIME value indicating the earliest date and time (in UTC) that the server is willing to  
1567 accept for any DATE or DATE-TIME value in a calendar object resource stored in a calendar collection.

## 1568 8.8 description

1569 <http://docs.oasis-open.org/ns/wscal/calws/description>

1570 Provides some descriptive text for the targeted collection.

## 1571 8.9 timezone-service relation.

1572 <http://docs.oasis-open.org/ns/wscal/calws/timezone-service>

1573 The location of a timezone service used to retrieve timezone information and specifications. This may be  
1574 an absolute URL referencing some other service or a relative URL if the current server also provides a  
1575 timezone service.

```
1576 <Link rel="http://docs.oasis-open.org/ns/wscal/calws/calws/timezone-service"  
1577 href="http://example.com/tz" />
```

## 1578 8.10 principal-home relation.

1579 <http://docs.oasis-open.org/ns/wscal/calws/principal-home>

1580 Provides the URL to the user home for the currently authenticated principal.

```
1581 <Link rel="http://docs.oasis-open.org/ns/wscal/calws/principal-home"  
1582 href="http://example.com/user/fred" />
```

## 1583 8.11 current-principal-freebusy relation.

1584 <http://docs.oasis-open.org/ns/wscal/calws/current-principal-freebusy>

1585 Provides the URL to use as a target for freebusy requests for the current authenticated principal.

```
1586 <Link rel="http://docs.oasis-open.org/ns/wscal/calws/current-principal-freebusy"  
1587 href="http://example.com/freebusy/user/fred" />
```

## 1588 8.12 principal-freebusy relation.

1589 <http://docs.oasis-open.org/ns/wscal/calws/principal-freebusy>

1590 Provides the URL to use as a target for freebusy requests for a different principal.

```
1591 <Link rel="http://docs.oasis-open.org/ns/wscal/calws/principal-freebusy"  
1592 href="http://example.com/freebusy" />
```

## 1593 8.13 child-collection relation.

1594 <http://docs.oasis-open.org/ns/wscal/calws/child-collection>

1595 Provides information about a child collections for the target. The href attribute gives the URI of the  
1596 collection. The element should only have CalWS child elements giving the type of the collection, that is  
1597 the CalWS:collection link property and the CalWS-calendar-collection link property. This allows clients to  
1598 determine the structure of a hierarchical system by targeting each of the child collections in turn.

1599 The xrd:title child element of the link element provides a description for the child-collection.

```
1600 <Link rel="http://http://docs.oasis-open.org/ns/wscal/calws/child-collection"  
1601 href="http://example.com/calws/user/fred/calendar">  
1602 <Title xml:lang="en">Calendar</Title>  
1603 <Property type="http://docs.oasis-open.org/ns/wscal/calws/collection"  
1604 xsi:nil="true" />
```

1605  
1606  
1607  
1608

```
<Property type="http://docs.oasis-open.org/ns/wscal/calws/calendar-  
collection"  
xsi:nil="true" />  
</Link>
```

## 1609 **8.14 created link property**

1610 <http://docs.oasis-open.org/ns/wscal/calws/created>

1611 Appears within a link relation describing collections or entities. The value is a date-time as defined in  
1612 RFC3339 Section 5.6

1613  
1614

```
<Property type="http://docs.oasis-open.org/ns/wscal/calws/created"  
>1985-04-12T23:20:50.52Z</Property>
```

## 1615 **8.15 last-modified property**

1616 <http://docs.oasis-open.org/ns/wscal/calws/last-modified>

1617 Appears within an xrd object describing collections or entities. The value is the same format as would  
1618 appear in the Last-Modified header and is defined in **[RFC2616]**, Section 3.3.1

1619  
1620

```
<Property type="http://docs.oasis-open.org/ns/wscal/calws/last-modified"  
>Mon, 12 Jan 1998 09:25:56 GMT</Property>
```

## 1621 **8.16 displayname property**

1622 <http://docs.oasis-open.org/ns/wscal/calws/displayname>

1623 Appears within an xrd object describing collections or entities. The value is a localized name for the entity  
1624 or collection.

1625  
1626

```
<Property type="http://docs.oasis-open.org/ns/wscal/calws/displayname"  
>My Calendar</Property>
```

## 1627 **8.17 timezone property**

1628 <http://docs.oasis-open.org/ns/wscal/calws/timezone>

1629 Appears within an xrd object describing collections. The value is a text timezone identifier.

1630  
1631

```
<Property type="http://docs.oasis-open.org/ns/wscal/calws/timezone"  
>America/New_York</Property>
```

## 1632 **8.18 owner property**

1633 <http://docs.oasis-open.org/ns/wscal/calws/owner>

1634 Appears within an xrd object describing collections or entities. The value is a server specific uri.

1635  
1636

```
<Property type="http://docs.oasis-open.org/ns/wscal/calws/owner"  
>/principals/users/mike</Property>
```

## 1637 **8.19 collection link property**

1638 <http://docs.oasis-open.org/ns/wscal/calws/collection>

1639 Appears within a link relation describing collections or entities. The property takes no value and indicates  
1640 that this child element is a collection.

1641  
1642

```
<Property type="http://docs.oasis-open.org/ns/wscal/calws/collection"  
xsi:nil="true" />
```

## 1643 **8.20 calendar-collection link property**

1644 <http://docs.oasis-open.org/ns/wscal/calws/calendar-collection>

1645 Appears within a link relation describing collections or entities. The property takes no value and indicates  
1646 that this child element is a calendar collection.

```
1647 <Property type="http://docs.oasis-open.org/ns/wscal/calws/calendar-collection"  
1648 xsi:nil="true" />
```

## 1649 **8.21 CalWS:privilege-set XML element**

1650 <http://docs.oasis-open.org/ns/wscal/calws/privilege-set>

1651 Appears within a link relation describing collections or entities and specifies the set of privileges allowed  
1652 to the current authenticated principal for that collection or entity.

```
1653 <!ELEMENT calws:privilege-set (calws:privilege*)>  
1654 <!ELEMENT calws:privilege ANY>
```

1655 Each privilege element defines a privilege or access right. The following set is currently defined

- 1656 • CalWS: Read - current principal has read access
- 1657 • CalWS: Write - current principal has write access

```
1658 <calWS:privilege-set>  
1659 <calWS:privilege><calWS:read></calWS:privilege>  
1660 <calWS:privilege><calWS:write></calWS:privilege>  
1661 </calWS:privilege-set>
```

1662

## 9 Retrieving Collection and Service Properties

1663 Properties, related services and locations are obtained from the service or from service resources in the  
1664 form of an XRD document as defined by [XRD-1.0].

1665 Given the URL of a CalWS service a client retrieves the service XRD document through a GET on the  
1666 service URL with an ACCEPT header specifying application/xrd+xml.

1667 Retrieving resource properties is identical to obtaining service properties, that is, execute a GET on the  
1668 target URL with an ACCEPT header specifying application/xrd+xml.

1669 The service properties define the global limits and defaults. Any properties defined on collections within  
1670 the service hierarchy override those service defaults. The service may choose to prevent such overriding  
1671 of defaults and limits when appropriate.

### 1672 9.1 Request parameters

- 1673 • None

### 1674 9.2 Responses:

- 1675 • 200: OK
- 1676 • 403: Forbidden
- 1677 • 404: Not found

### 1678 9.3 Example - retrieving server properties:

```
1679 >>Request
1680
1681 GET / HTTP/1.1
1682 Host: example.com
1683 ACCEPT:application/xrd+xml
1684
1685 >>Response
1686 <XRD xmlns="http://docs.oasis-open.org/ns/xri/xrd-1.0"
1687     xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
1688   <Expires>1970-01-01T00:00:00Z</Expires>
1689   <Subject>http://example.com/calws</Subject>
1690   <Property type="http://docs.oasis-open.org/ns/wscal/calws/created"
1691     >1970-01-01</Property>
1692
1693   <Link rel="http://docs.oasis-open.org/ns/wscal/calws/timezone-service"
1694     href="http://example.com/tz" />
1695
1696   <calWS:privilege-set>
1697   <calWS:privilege><calWS:read></calWS:privilege>
1698   </calWS:privilege-set>
1699
1700   <Link rel="http://docs.oasis-open.org/ns/wscal/calws/principal-home"
1701     type="collection"
1702     href="http://example.com/calws/user/fred">
1703   <Title xml:lang="en">Fred's calendar home</Title>
1704   </Link>
1705
1706   <Link rel="http://docs.oasis-open.org/ns/wscal/calws/child-collection"

## 10 Creating Calendar Object Resources

Creating calendar object resources is carried out by a POST on the parent collection. The body of the request will contain the resource being created. The request parameter "action=create" indicates this POST is a create. The location header of the response gives the URL of the newly created object.

### 10.1 Request parameters

- action=create

### 10.2 Responses:

- 201: created
- 403: Forbidden - no access

### 10.3 Preconditions for Calendar Object Creation

- **CalWS:target-exists:** The target of a PUT must exist. Use POST to create entities and PUT to update them.
- **CalWS:not-calendar-data:** The resource submitted in the PUT request, or targeted by a COPY or MOVE request, MUST be a supported media type (i.e., iCalendar) for calendar object resources;
- **CalWS:invalid-calendar-data:** The resource submitted in the PUT request, or targeted by a COPY or MOVE request, MUST be valid data for the media type being specified (i.e., MUST contain valid iCalendar data);
- **CalWS:invalid-calendar-object-resource:** The resource submitted in the PUT request, or targeted by a COPY or MOVE request, MUST obey all restrictions specified in Calendar Object Resources (e.g., calendar object resources MUST NOT contain more than one type of calendar component, calendar object resources MUST NOT specify the iCalendar METHOD property, etc.);
- **CalWS:unsupported-calendar-component:** The resource submitted in the PUT request, or targeted by a COPY or MOVE request, MUST contain a type of calendar component that is supported in the targeted calendar collection;
- **CalWS:uid-conflict:** The resource submitted in the PUT request, or targeted by a COPY or MOVE request, MUST NOT specify an iCalendar UID property value already in use in the targeted calendar collection or overwrite an existing calendar object resource with one that has a different UID property value. Servers SHOULD report the URL of the resource that is already making use of the same UID property value in the CalWS:href element  
<!ELEMENT uid-conflict (CalWS:href)>
- **CalWS:invalid-calendar-collection-location:** In a COPY or MOVE request, when the Request-URI is a calendar collection, the Destination-URI MUST identify a location where a calendar collection can be created;
- **CalWS:exceeds-max-resource-size:** The resource submitted in the PUT request, or targeted by a COPY or MOVE request, MUST have an octet size less than or equal to the value of the CalDAV:max-resource-size property value on the calendar collection where the resource will be stored;
- **CalWS:before-min-date-time:** The resource submitted in the PUT request, or targeted by a COPY or MOVE request, MUST have all of its iCalendar DATE or DATE-TIME property values (for each recurring instance) greater than or equal to the value of the CalDAV:min-date-time property value on the calendar collection where the resource will be stored;

- 1762 • **CalWS:after-max-date-time:** The resource submitted in the PUT request, or targeted by a COPY  
1763 or MOVE request, MUST have all of its iCalendar DATE or DATE-TIME property values (for each  
1764 recurring instance) less than the value of the CalDAV:max-date-time property value on the calendar  
1765 collection where the resource will be stored;
- 1766 • **CalWS:too-many-instances:** The resource submitted in the PUT request, or targeted by a COPY  
1767 or MOVE request, MUST generate a number of recurring instances less than or equal to the value  
1768 of the CalDAV: max-instances property value on the calendar collection where the resource will be  
1769 stored;
- 1770 • **CalWS:too-many-attendees-per-instance:** The resource submitted in the PUT request, or  
1771 targeted by a COPY or MOVE request, MUST have a number of ATTENDEE properties on any one  
1772 instance less than or equal to the value of the CalDAV:max-attendees-per-instance property value  
1773 on the calendar collection where the resource will be stored;

## 1774 10.4 Example - successful POST:

```
1775 >>Request
1776
1777 POST /user/fred/calendar/?action=create HTTP/1.1
1778 Host: example.com
1779 Content-Type: application/xml+calendar; charset="utf-8"
1780 Content-Length: ?
1781
1782 <?xml version="1.0" encoding="utf-8" ?>
1783 <icalendar xmlns="urn:ietf:params:xml:ns:icalendar-2.0">
1784   <vcalendar>
1785     ...
1786   </vcalendar>
1787 </icalendar>
1788
1789 >>Response
1790
1791 HTTP/1.1 201 Created
1792 Location: http://example.com/user/fred/calendar/event1.ics
```

## 1793 10.5 Example - unsuccessful POST:

```
1794 >>Request
1795
1796 POST /user/fred/readcalendar/?action=create HTTP/1.1
1797 Host: example.com
1798 Content-Type: text/text; charset="utf-8"
1799 Content-Length: ?
1800
1801 This is not an xml calendar object
1802
1803 >>Response
1804
1805 HTTP/1.1 403 Forbidden
1806 <?xml version="1.0" encoding="utf-8"
1807   xmlns:D="DAV:"
1808   xmlns:C="urn:ietf:params:xml:ns:caldav" ?>
1809 <D:error>
1810   <C:supported-calendar-data/>
1811   <D:description>Not an icalendar object</C:description>
1812 </D:error>
```

1813

## 11 Retrieving resources

1814 A simple GET on the href will return a named resource. If that resource is a recurring event or task with  
1815 overrides, the entire set will be returned. The desired format is specified in the ACCEPT header. The  
1816 default form is application/xml+calendar

1817

### 11.1 Request parameters

1818

- none

1819

### 11.2 Responses:

1820

- 200: OK

1821

- 403: Forbidden - no access

1822

- 406 The requested format specified in the accept header is not supported.

1823

### 11.3 Example - successful fetch:

1824

```
>>Request
```

1825

```
GET /user/fred/calendar/event1.ics HTTP/1.1
```

1826

```
Host: example.com
```

1827

1828

```
>>Response
```

1829

1830

```
HTTP/1.1 200 OK
```

1831

```
Content-Type: application/xml+calendar; charset="utf-8"
```

1832

```
Content-Length: ?
```

1833

1834

```
<?xml version="1.0" encoding="utf-8" ?>
```

1835

```
<icalendar xmlns="urn:ietf:params:xml:ns:icalendar-2.0">
```

1836

```
<vcalendar>
```

1837

```
...
```

1838

```
</vcalendar>
```

1839

```
</icalendar>
```

1840

1841

### 11.4 Example - unsuccessful fetch:

1842

```
>>Request
```

1843

```
PUT /user/fred/calendar/noevent1.ics HTTP/1.1
```

1844

```
Host: example.com
```

1845

1846

```
>>Response
```

1847

1848

```
HTTP/1.1 404 Not found
```

1849

1850

## 12 Updating resources

1851 Resources are updated with the PUT method targeted at the resource href. The body of the request  
1852 contains a complete new resource which effectively replaces the targeted resource. To allow for optimistic  
1853 locking of the resource use the if-match header.

1854 When updating a recurring event all overrides and master must be supplied as part of the content.

1855 Preconditions as specified in Section 10.3 are applicable.

### 12.1 Responses:

- 1857 • 200: OK
- 1858 • 304: Not modified - entity was modified by some other request
- 1859 • 403: Forbidden - no access, does not exist etc. See error response

1860

1861

#### *Example 16: Successful Update*

1862

```
>>Request
```

1863

```
PUT /user/fred/calendar/event1.ics HTTP/1.1
```

1865

```
Host: example.com
```

1866

```
Content-Type: application/xml+calendar; charset="utf-8"
```

1867

```
Content-Length: ?
```

1868

1869

```
<?xml version="1.0" encoding="utf-8" ?>
```

1870

```
<icalendar xmlns="urn:ietf:params:xml:ns:icalendar-2.0">
```

1871

```
<vcalendar>
```

1872

```
...
```

1873

```
</vcalendar>
```

1874

```
</icalendar>
```

1875

1876

```
>>Response
```

1877

1878

```
HTTP/1.1 200 OK
```

1879

#### *Example 17: Unsuccessful Update*

1880

```
>>Request
```

1881

```
PUT /user/fred/readcalendar/event1.ics HTTP/1.1
```

1883

```
Host: example.com
```

1884

```
Content-Type: application/xml+calendar; charset="utf-8"
```

1885

```
Content-Length: ?
```

1886

1887

```
<?xml version="1.0" encoding="utf-8" ?>
```

1888

```
<icalendar xmlns="urn:ietf:params:xml:ns:icalendar-2.0">
```

1889

```
<vcalendar>
```

1890

```
...
```

1891

```
</vcalendar>
```

1892

```
</icalendar>
```

1893

1894

```
>>Response
```

1895

1896

```
HTTP/1.1 403 Forbidden
```

## 13 Deletion of resources

1908 Delete is defined in **[RFC 2616]** Section 9.7. In addition to conditions defined in that specification, servers  
1909 must remove any references from the deleted resource to other resources. Resources are deleted with  
1910 the DELETE method targeted at the resource URL. After a successful completion of a deletion a GET on  
1911 that URL must result in a 404 - Not Found status.

1912

### 13.1 Delete for Collections

1913 Delete for collections may or may not be supported by the server. Certain collections are considered  
1914 undeletable. On a successful deletion of a collection all contained resources to any depth must also be  
1915 deleted.

1916

### 13.2 Responses:

1917

- 200: OK

1918

- 403: Forbidden - no access

1919

- 404: Not Found

---

## 1920 14 Querying calendar resources

1921 Querying provides a mechanism by which information can be obtained from the service through possibly  
1922 complex queries. A list of icalendar properties can be specified to limit the amount of information returned  
1923 to the client. A query takes the parts

- 1924 • Limitations on the data returned
- 1925 • Selection of the data
- 1926 • Optional timezone id for floating time calculations.

1927 The current specification uses CalDAV multiget and calendar-query XML bodies as specified in [RFC  
1928 4791] with certain limitations and differences.

- 1929 1. The POST method is used for all requests, the action being identified by the outer element.
- 1930 2. While CalDAV servers generally only support [RFC 5545] and assume that as the default, the  
1931 delivery format for CalWS will, by default, be [draft-xcal].
- 1932 3. The CalDAV query allows the specification of a number of DAV properties. Specification of these  
1933 properties, with the exception of DAV:getetag, is considered an error in CalWS.
- 1934 4. The CalDAV:propnames element is invalid

1935 With those differences, the CalDAV specification is the normative reference for this operation.

### 1936 14.1 Limiting data returned

1937 This is achieved by specifying one of the following

- 1938 • CalDAV:allprop return all properties (some properties are specified as not being part of the allprop  
1939 set so are not returned)
- 1940 • CalDAV:prop An element which contains a list of properties to be returned . May only contain  
1941 DAV:getetag and CalDAV:calendar-data

1942 Of particular interest, and complexity, is the calendar-data property which can contain a time range to limit  
1943 the range of recurrences returned and/or a list of calendar properties to return.

### 1944 14.2 Pre/postconditions for calendar queries

1945 The preconditions as defined in in [RFC 4791] Section 7.8 apply here. CalDav errors may be reported by  
1946 the service when preconditions or postconditions are violated.

### 1947 14.3 Example: time range limited retrieval

1948 This example shows the time-range limited retrieval from a calendar which results in 2 events, one a  
1949 recurring event and one a simple non-recurring event.

```

## 15 Free-busy queries

2159 Free-busy queries are used to obtain free-busy information for a calendar-collection or principals. The  
2160 result contains information only for events to which the current principal has sufficient access.

2161 When targeted at a calendar collection the result is based only on the calendaring entities contained in  
2162 that collection. When targeted at a principal free-busy URL the result will be based on all information  
2163 which affect the principals free-busy status, for example availability.

2164 The possible targets are:

- 2165 • A calendar collection URL
- 2166 • The XRD link with relation CalWS/current-principal-freebusy
- 2167 • The XRD link with relation CalWS/principal-freebusy with a principal given in the request.

2168 The query follows the specification defined in Error! Reference source not found. with certain limitations.  
2169 As an authenticated user to the CalWS service scheduling read-freebusy privileges must have been  
2170 granted. As an unauthenticated user equivalent access must have been granted to unauthenticated  
2171 access.

2172 Freebusy information is returned by default as xcalendar vfreebusy components, as defined by **[draft-  
2173 xcal]**. Such a component is not meant to conform to the requirements of VFREEBUSY components in  
2174 **[RFC 5546]**. The VFREEBUSY component SHOULD conform to section "4.6.4 Free/Busy Component" of  
2175 **[RFC 5545]**. A client SHOULD ignore the ORGANIZER field..

2176 Since a Freebusy query can only refer to a single user, a client will already know how to match the result  
2177 component to a user. A server MUST only return a single vfreebusy component.

### 2178 15.1 ACCEPT header

2179 The Accept header is used to specify the format for the returned data. In the absence of a header the  
2180 data should be returned as specified in **[draft-xcal]**, that is, as if the following had been specified

2181 `ACCEPT: application/xml+calendar`

### 2182 15.2 URL Query Parameters

2183 None of these parameters are required except for the conditions noted below. Appropriate defaults will be  
2184 supplied by the server.

#### 2185 15.2.1 start

2186 **Default:** The default value is left up to the server. It may be the current day, start of the current  
2187 month, etc.

2188 **Description:** Specifies the start date for the Freebusy data. The server is free to ignore this value and  
2189 return data in any time range. The client must check the data for the returned time range.

2190 **Format:** A profile of an **[RFC3339]** Date/Time. Fractional time is not supported. The server MUST  
2191 support the expanded version e.g.

2192 `2007-01-02T13:00:00-08:00`

2193 It is up to the server to interpret local date/times.

2194 **Example:**

2195 `2007-02-03T15:30:00-0800`  
2196 `2007-12-01T10:15:00Z`

2197 **Notes:** Specifying only a start date/time without specifying an end-date/time or period should be  
2198 interpreted as in **[RFC 5545]**. The effective period should cover the remainder of that day.

2199 Date-only values are disallowed as the server cannot determine the correct start of the day. Only

2200 UTC or date/time with offset values are permitted.

## 2201 15.2.2 end

2202 **Default:** Same as start

2203 **Description:** Specifies the end date for the Freebusy data. The server is free to ignore this value.

2204 **Format:** Same as start

2205 **Example:** Same as start

## 2206 15.2.3 period

2207 **Default:** The default value is left up to the server. The recommended value is "P42D".

2208 **Description:** Specifies the amount of Freebusy data to return. A client cannot specify both a period  
2209 and an end date. Period is relative to the start parameter.

2210 **Format:** A duration as defined in section 4.3.6 of [RFC 5545]

2211 **Example:**

2212 P42D

## 2213 15.2.4 account

2214 **Default:** none

2215 **Description:** Specifies the principal when the request is targeted at the XRD CalWS/principal-  
2216 freebusy. Specification of this parameter is an error otherwise.

2217 **Format:** Server specific

2218 **Example:**

2219 fred  
2220 /principals/users/jim  
2221 user1@example.com

## 2222 15.3 URL parameters - notes

2223 The server is free to ignore the start, end and period parameters. It is recommended that the server return  
2224 at least 6 weeks of data from the current day.

2225 A client MUST check the time range in the VFREEBUSY response as a server may return a different time  
2226 range than the requested range.

## 2227 15.4 HTTP Operations

2228 The server SHOULD return an Etag response header for a successful GET request targeting a Freebusy  
2229 read URL. Clients MAY use the Etag response header value to do subsequent "conditional" GET  
2230 requests that will avoid re-sending the Freebusy data again if it has not changed.

## 2231 15.5 Response Codes

2232 Below are the typical status codes returned by a GET request targeting a Free-busy URL. Note that other  
2233 HTTP status codes not listed here might also be returned by a server.

2234 • 200 OK

2235 • 302 Found

2236 • 400 Start parameter could not be understood / End parameter could not be understood / Period  
2237 parameter could not be understood

2238 • 401 Unauthorized

- 2239 • 403 Forbidden
- 2240 • 404 The data for the requested principal is not currently available, but may be available later.
- 2241 • 406 The requested format in the accept header is not supported.
- 2242 • 410 The data for the requested principal is no longer available
- 2243 • 500 General server error

## 2244 15.6 Examples

2245 The following are examples of URLs used to retrieve Free-busy data for a user:

```
2246 http://www.example.com/freebusy/user1@example.com?

2357         </xc:vcalendar>
2358     </xc:icalendar>

```

2359 A URL for which the server does not have any data for that user:

```
2360 >> Request <<
2361 GET /freebusy/user1@example.com?start=2012-12-01T00:00:00-08:00&end=2012-12-
2362 31T00:00:00-08:00
2363 HTTP/1.1
2364 Host: www.example.com
2365
2366 >> Response <<
2367 HTTP/1.1 404 No data
2368
```

---

2369 **16 Conformance**

2370 WS-Calendar Intervals SHALL have a Duration. Intervals MAY have a StartTime. Intervals SHALL NOT  
2371 include an END time. If a non-compliant Interval is received with an END time, it may be ignored.

2372 A performance component SHALL not include Start, Stop, and Duration elements. Two out of the three  
2373 elements is acceptable, but not three.

2374 In Partitions, the Description, Summary and Priority of each Interval SHALL be excluded.

2375 An Calendar Gluon may either have a dtStart or a dtEnd, but may not have both.

2376 *All OASIS specifications require conformance*

2377

---

## A. Acknowledgements

2378 The following individuals have participated in the creation of this specification and are gratefully  
2379 acknowledged:

2380 **Participants:**

## 2410 **B. An Introduction to Internet Calendaring**

2411 *The WS-Calendar Technical Committee thanks CalConnect for contributing this overview of iCalendar*  
2412 *and its use.*

### 2413 **B.1 icalendar**

#### 2414 **B.1.1 History**

2415 The iCalendar specification was first produced by the IETF in 1998 as RFC 2445 [1]. Since then it has  
2416 become the dominant standard for calendar data interchange on the internet and between devices  
2417 (desktop computers, mobile phones etc.). The specification was revised in 2009 as RFC 5545 [4].

2418 Alongside iCalendar is the iTIP specification (RFC 2446 [2] and revised as RFC 5546[5]) that defines how  
2419 iCalendar is used to carry out scheduling operations (for example, how an organizer can invite attendees  
2420 to a meeting and receive their replies). This forms the basis for email-based scheduling using iMIP (the  
2421 specification that describes how to use iTIP with email - RFC 2447 [3]).

2422 iCalendar itself is a text-based data format. However, an XML format is also available, providing a one-to-  
2423 one mapping to the text format (draft [7]).

2424 iCalendar data files typically have a .ics file name extension. Most desktop calendar clients can import or  
2425 export iCalendar data, or directly access such data over the Internet using a variety of protocols.

#### 2426 **B.1.2 Data model**

2427 The iCalendar data format has a well defined data model. "iCalendar objects" encompass a set of  
2428 "iCalendar components" each of which contains a set of "iCalendar properties" and possibly other sub-  
2429 components. An iCalendar property consists of a name, a set of optional parameters (specified as "key-  
2430 value" pairs) and a value.

2431 iCalendar components include:

2432 "VEVENT" which represents an event

2433 "VTODO" which represents a task or to-do

2434 "VJOURNAL" which represents a journal entry

2435 "VFREEBUSY" which represents periods of free or busy time information

2436 "VTIMEZONE" which represents a timezone definition (timezone offset and daylight saving rules)

2437 "VALARM" is currently the only defined sub-component and is used to set alarms or reminders on events  
2438 or tasks.

2439 Properties include:

2440 "DTSTART" which represents a start time for a component

2441 "DTEND" which represents an end time for a component

2442 "SUMMARY" which represents a title or summary for a component

2443 "RRULE" which can specify rules for repeating events or tasks (for example, every day, every week on  
2444 Tuesdays, etc.)

2445 "ORGANIZER" which represents the calendar user who is organizing an event or assigning a task

2446 "ATTENDEE" which represents calendar users attending an event or assigned a task

2447 In addition to this data model and the pre-defined properties, the specification defines how all those are  
2448 used together to define the semantics of calendar objects and scheduling. The semantics are basically a  
2449 set of rules stating how all the components and properties are used together to ensure that all iCalendar  
2450 products can work together to achieve good interoperability. For example, a rule requires that all events  
2451 must have one and only one "DTSTART" property. The most important part of the iCalendar specification

2452 is the semantics of the calendaring model that it represents. The use of text or XML to encode those is  
2453 secondary.

### 2454 **B.1.3 Scheduling**

2455 The iTIP specification defines how iCalendar objects are exchanged in order to accomplish the key task  
2456 needed to schedule events or tasks. An example of a simple workflow is as follows:

- 2457 1. To schedule an event, an organizer creates the iCalendar object representing the event and adds  
2458 calendar users as attendees.
- 2459 2. The organizer then sends an iTIP "REQUEST" message to all the attendees.
- 2460 3. Upon receipt of the scheduling message, each attendee can decide whether they want to attend  
2461 the meeting or not.
- 2462 4. Each attendee can then respond back to the organizer using an iTIP "REPLY" message  
2463 indicating their own attendance status.

2464 iTIP supports other types of scheduling messages, for example, to cancel meetings, add new instances to  
2465 a repeating meeting, etc.

### 2466 **B.1.4 Extensibility**

2467 iCalendar was designed to be extensible, allowing for new components, properties and parameters to be  
2468 defined as needed. A registry exists to maintain the list of standard extensions with references to their  
2469 definitions to ensure anyone can use them and work well with others.

## 2470 **B.2 Calendar data access and exchange protocols**

### 2471 **B.2.1 Internet Calendar Subscriptions**

2472 An Internet calendar subscription is simply an iCalendar data file made available on a web server. Users  
2473 can use this data in two ways:

- 2474 – The data can be downloaded from the web server and then imported directly into an iCalendar  
2475 aware client. This solution works well for calendar data that is not likely to change over time (for  
2476 example the list of national holidays for the next year).
- 2477 – Calendar clients that support "direct" subscriptions can use the URL to the calendar data on the  
2478 web server to download the calendar data themselves. Additionally, the clients can check the web  
2479 server on a regular basis for updates to the calendar data, and then update their own cached  
2480 copy of it. This allows calendar data that changes over time to be kept synchronized.

### 2481 **B.2.2 CalDAV**

2482 CalDAV is a calendar access protocol and is defined in RFC 4791 [6]. The protocol is based on WebDAV  
2483 which is an extension to HTTP that provides enhanced capabilities for document management on web  
2484 servers.

2485 CalDAV is used in a variety of different environments, ranging from very large internet service providers,  
2486 to large and small corporations or institutions, and to small businesses and individuals.

2487 CalDAV clients include desktop applications, mobile devices and browser-based solutions. It can also be  
2488 used by "applets", for example, a web page panel that displays a user's upcoming events.

2489 One of the key aspects of CalDAV is its data model. Simply put, it defines a "calendar home" for each  
2490 calendar user, within which any number of "calendars" can be created. Each "calendar" can contain any  
2491 number of iCalendar objects representing individual events, tasks or journal entries. This data model  
2492 ensures that clients and servers can interoperate well.

2493 In addition to providing simple operations to read, write and delete calendar data, CalDAV provides a  
2494 querying mechanism to allow clients to fetch calendar data matching specific criteria. This is commonly

2495 used by clients to do "time-range" queries, i.e., find the set of events that occur within a given start/end  
2496 time period.

2497 CalDAV also supports access control allowing for features such as delegated calendars and calendar  
2498 sharing.

2499 CalDAV also specifies how scheduling operations can be done using the protocol. Whilst it uses the  
2500 semantics of the iTIP protocol, it simplifies the process by allowing simple calendar data write operations  
2501 to trigger the sending of scheduling messages, and it has the server automatically process the receipt of  
2502 scheduling messages. Scheduling can be done with other users on the CalDAV server or with calendar  
2503 users on other systems (via some form of "gateway").

### 2504 **B.2.3 ActiveSync/SyncML**

2505 ActiveSync and SyncML are technologies that allow multiple devices to synchronize data with a server,  
2506 with calendar data being one of the classes of data supported. These have typically been used for low-  
2507 end and high-end mobile devices.

### 2508 **B.2.4 CalWS**

2509 CalWS is a web services calendar access API developed by The Calendaring and Scheduling  
2510 Consortium and the OASIS organization, to be used as part of the Oasis WS-Calendar standard. It  
2511 provides an API to access and manipulate calendar data stored on a server. It follows a similar data  
2512 model to CalDAV and has been designed to co-exist with a CalDAV service offering the same data.

### 2513 **B.2.5 iSchedule**

2514 iSchedule is a protocol to allow scheduling between users on different calendaring systems and across  
2515 different internet domains. It transports iTIP scheduling messages using HTTP between servers. Servers  
2516 use DNS and various security mechanisms to determine the authenticity of messages received.

2517 It has been specifically designed to be independent of any calendar system in use at the endpoints, so  
2518 that it is compatible with many different systems. This allows organizations with different calendar  
2519 systems to exchange scheduling messages with each other, and also allows a single organization with  
2520 multiple calendar systems (for example due to mergers, or different departmental requirements) to  
2521 exchange scheduling messages between users of each system.

2534 **C. Overview of WS-Calendar, its Antecedents and its**  
 2535 **Use**

2536 iCalendar has long been the predominant message format for an Internet user to send meeting requests  
 2537 and tasks to other Internet users by email. The recipient can respond to the sender easily or counter  
 2538 propose another meeting date/time. iCalendar support is built into all major email systems and email  
 2539 clients. While SMTP is the predominant means to transport iCalendar messages, protocols including  
 2540 WebDAV and SyncML are used to transport collections of iCalendar information. No similar standard for  
 2541 service interactions has achieved similar widespread use.

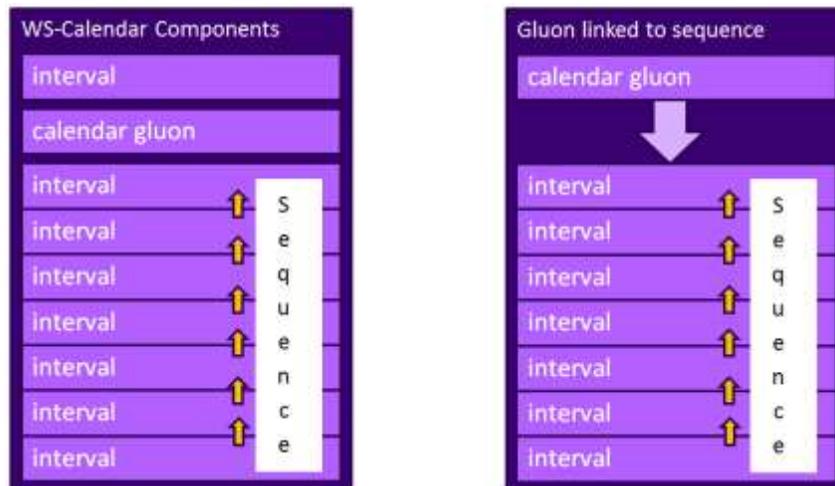

2542 The Calendar and Scheduling Consortium (CalConnect), working within the IETF, updated the iCalendar  
 2543 standard in the summer of 2009 to support extension ([RFC5545]). In 2010, the same group defined  
 2544 [XCAL], a canonical XML serialization for iCalendar, currently (08/21/2008) on the recommended  
 2545 standards track within the IETF. This specification supports extensions, including handling non-standard,  
 2546 i.e., non-iCalendar, data during message storage and retrieval.

2547 WS-Calendar builds on this work, and consists of extensions to the vocabulary of iCalendar, along with  
 2548 standard services to extend calendaring and scheduling into service interactions. iCalendar consists of a  
 2549 number of fields that support the delivery, update, and synchronization of if calendar messages and a list  
 2550 of components. The components can specify defined relationships between each other.

2551  
 2552 *Figure 3: iCalendar overview*

2553 WS-Calendar defines the Interval, a profile of the vtodo component requiring only a duration and an  
 2554 artifact to define service delivery and performance. WS-Calendar also defines the CalendarGluon  
 2555 component, a container for holding only a service delivery and performance artifact, to associate with a  
 2556 component or group of components.

2558

Figure 4: WS-Calendar and EMIX

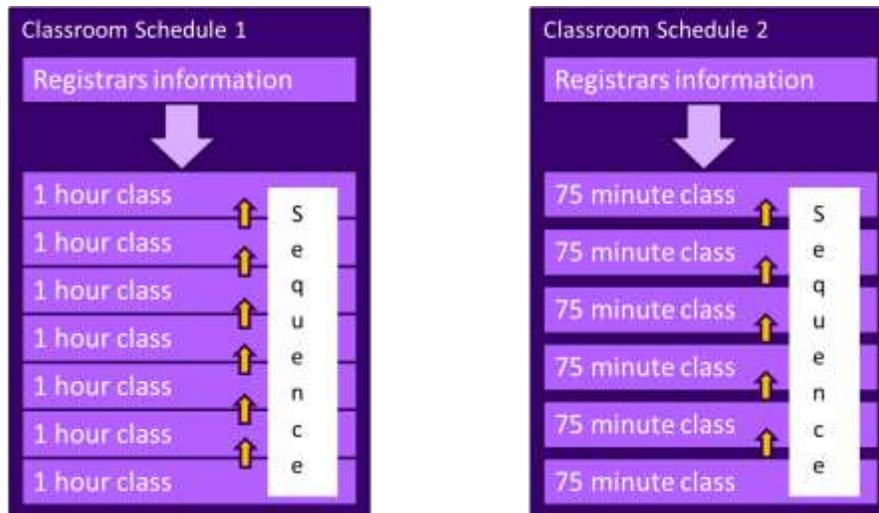

2559 A set of intervals that have defined temporal relationships is a Sequence. Temporal relationships express  
2560 how the occurrence of one interval is related to another. For example, Interval B may begin 10 minutes  
2561 after Interval A completes, or Interval D may start 5 minutes after Interval C starts. An Calendar Gluon  
2562 linked to a Sequence defines service performance for all Intervals in the Sequence. Because each  
2563 interval has its own service performance contract, specifications built on WS-Calendar can define rules for  
2564 inheritance and over-rides with a sequence.

2565 The Partition is a sub-class of a Sequence in which all Intervals follow consecutively with no lag time.  
2566 Intervals in a Partition normally have the same Duration, but WS-Calendar does support overriding the  
2567 duration on an individual basis.

## 2568 C.1 Scheduling Sequences

2569 A Sequence is a general pattern of behaviors and results that does not require a specific schedule. A  
2570 publishing service may advertise a Sequence with no schedule, i.e., no specific time for performance.  
2571 When the Sequence is invoked or contracted, a specific performance time is added. In the original  
2572 iCalendar components, this would add the starting date and time (dtStart) to the component. In WS-  
2573 Calendar, we add the starting date and time only to the first Interval of a Sequence; the performance  
2574 times for all other Intervals in the Sequence are derived from that one start time.

### 2575 C.1.1 Academic Scheduling example

2576

2577

Figure 5: Classroom Scheduling Example

2578 A college campus uses two schedules to schedule its buildings. In Schedule 1, classes start on the hour,  
2579 and follow one after another; each class starts on the hour. In the second schedule, each class lasts an  
2580 hour and a quarter, and there is a fifteen minute gap between classes; classes start on the half hour. On  
2581 many campuses, the sequence in Schedule 1 may describe classes taught on Monday, Wednesday, and  
2582 Friday. Schedule 2 may describe classes taught on Tuesday and Thursday.

2583 The registrar's office knows some key facts about each classroom, including whether it hosts a class  
2584 during a particular period, and the number of students that will be in that class. The college wishes to  
2585 optimize the provision of building services for each class. Such services may include adequate ventilation  
2586 and comfortable temperatures to assure alert students. Other services may ensure that the classroom  
2587 projection systems and A/V support services are warmed up in advance of a class, or powered off when a  
2588 classroom is vacant.

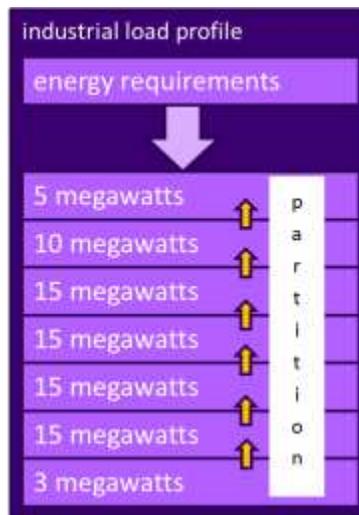

2589 Although most classes meet over typical schedule for the week (M-W-F or Tu-Th), some classes may not  
2590 meet on Friday, or may have a tutorial section one day a week. The registrar's system, ever mindful of  
2591 student privacy, shares only minimal information with the building systems such as how many students  
2592 will be supported.

2593 The Registrar's system schedule building systems using the Calendar Gluon (registrar's information) and  
2594 the student counts for each interval, and schedules the Sequence in classroom schedule 1 three days a  
2595 week for the next 10 weeks. The Registrar's system also schedules the sequence in classroom schedule  
2596 2 two days a week, also for 10 weeks.

2597 This example demonstrates a system (A) that offers services using either of two sequences. Another  
2598 business system (B) with minimal knowledge of how (A) works determines the performance requirements  
2599 for (A). The business system (B) communicates these expectations are by scheduling the Sequences  
2600 offered by (A).

### 2601 C.1.2 Market Performance schedule

2602 A factory relies on an energy-intensive process which is performs twice a year for eight weeks. The  
2603 factory has some flexibility about scheduling the process; it can perform the work in either the early  
2604 morning or the early evening; it avoids the afternoon when energy costs are highest. The factory works up  
2605 a detailed profile of when it will need energy to support this process.

2606  
2607 *Figure 6: Daily Load Profile for Market Operations Example*

2608 Factory management has decided that they want to use only renewable energy products for this process.  
2609 They approach two regional wind farms with the intent of making committed purchases of wind energy.  
2610 The wind farms consider their proposals taking into account the seasonal weather forecasts they use to  
2611 project their weather capacity, and considering the costs that may be required to buy additional wind  
2612 energy on the spot market to make up any shortfalls.

2613 Each energy supplier submits of the same sequence, a schedule, i.e. a daily starting time, and a price for  
2614 the season's production. After considering the bids, and other internal costs of each proposal, the factory  
2615 opts to accept a contract for the purchase of a fixed load profile (Partition), using the evening wind  
2616 generation from one of the suppliers. This contract specifies Schedules of load purchases (starting data  
2617 and time for the sequence) for each day.

## D. Revision History

Revision	Date	Editor	Changes Made
1.0 WD 01	2010-03-11	Toby Considine	Initial document, largely derived from Charter
1.0 WD 02	2010-03-30	Toby Considine	Straw-man assertion of elements, components to push conversation
1.0 WD 03	2010-04-27	Toby Considine	Cleaned up Elements, added [XPOINTER] use, xs:duration elements
1.0 WD 04	2010-05-09	Toby Considine	Aligned Chapter 4 with the vAlarm and vToDo objects.
1.0 WD 05	2010-05-18	Toby Considine	Responded to comments, added references, made references to [XCAL] more consistent,
1.0 WD 06	2010-05-10	Toby Considine	Responded to comments from CalConnect, mostly constancy of explanations
1.0 WD 07	2010-07-28	Toby Considine	Incorporated input from informal public review, esp. SGIP PAP04. Firmed up relationships between scheduled objects
1.0 WD 08	2010-08-07	Toby Considine	Aligned with Interval / Partition / Sequence language. Reduced performance characteristics to before / after durations.
1.0 WD 09	2010-08-15	Toby Considine	Formalized Attachment section and rolled Performance into the Attachment. Created RelatedComponent object. Added CalWS Outline to specification. Removed SOOP section
1.0 WD 10	2010-08-28	Toby Considine, Benoit Lepeuple	Updated Time Stamp section Added background Appendices Incorporated Association language to replace RelatedComponent Recast examples to show inheritance, remove inconsistencies
1.0 WD 11	2010-09-11	Toby Considine	Traceability Release in support of a re-shuffling of the document. Sections 3, 4 were re-shuffled to create: 3: Interval / Relationships / Time Stamps 4: Performance / Attachments 5: Associations & Inheritance Also, changed all associations to Gluons. No paragraphs have been changed, just shuffled, changes accepted, to create clean base for editing
1.0 WD 12	2010-09-14	Toby Considine Dave Thewlis	Edits for clarity and flow following changes in WD11, updated examples based upon XSD artifacts. Adding final contribution from CalConnect for Services.
