## **Abstract**

The definition of a resource and the relationship between Web services and resources is defined in the document titled "Modeling Stateful Resources with Web services" [WS-Resource]. We refer to a stateful resource in this context as a WS-Resource. This specification defines message exchanges to standardize the means by which a WS-Resource may be destroyed, and resource properties [WS-ResourceProperties] that may be used to inspect and monitor the lifetime of a WS-Resource. This specification defines two means of destroying a WS-Resource: immediate destruction and time-based, scheduled destruction.

**Status**

This WS-ResourceLifetime specification is an initial draft release and is provided for review and evaluation only. The Companies hope to solicit your contributions and suggestions in the near future. The Companies make no warranties or representations regarding the specification in any manner whatsoever.

# 1 Introduction

In this document, we consider a distributed computing environment consisting of Web services and WS-Resources. The definition of WS-Resource and a pattern defining the relationship between Web services and WS-Resources is detailed in “Modeling Stateful Resources with Web services” [WS-Resource].

The lifecycle of a WS-Resource is defined as the period between its instantiation and its destruction. The WS-ResourceLifetime specification standardizes the means by which a WS-Resource can be destroyed. The specification also defines the means by which the lifetime of a WS-Resource can be monitored. However, this specification does not prescribe (nor proscribe) the means by which a WS-Resource is created.

Normally, a service requestor’s interest in a WS-Resource is for some period of time, rarely is it indefinite. In many scenarios, it is appropriate for clients of a WS-Resource to cause its immediate destruction. The immediate destruction of a WS-Resource may be accomplished using the message exchanges defined in this specification.

In addition, this specification defines the means by which a resource may be destroyed after the expiration of a period of time. In a distributed computing environment, a client may become disconnected from the service provider’s endpoint and therefore may be unable to, or unwilling to cause the immediate destruction of the WS-Resource. This specification defines the means by which any client of a WS-Resource may establish and extend the scheduled termination time of a WS-Resource. If that time expires, the WS-Resource may *self destruct* without the need for an explicit destroy request message from a client. Periodically extending the termination time of a WS-Resource can serve to extend its lifetime. WS-ResourceLifetime defines a standard message exchange by which a service requestor can establish and renew a scheduled termination time for the WS-Resource, and defines the circumstances under which a service requestor can determine that this termination time has elapsed.

A service requestor may want to determine the current time and the termination time of a WS-Resource from the perspective of the associated Web service. Thus, WS-ResourceLifetime defines resource properties, as defined in [WS-ResourceProperties] for accessing this information.

WS-ResourceLifetime is inspired by a portion of the Global Grid Forum’s “Open Grid Services Infrastructure (OGSI) Version 1.0” specification [OGSI].

## 1.1 Goals and Requirements

The goal of WS-ResourceLifetime is to standardize the terminology, concepts, message exchanges, WSDL and XML needed to monitor the lifetime of, and destroy WS-Resources associated with Web services as defined by the implied resource pattern [WS-Resource].

### 1.1.1 Requirements

This specification intends to meet the following requirements:

- Define the standard message exchange by which a requestor can request the immediate destruction of a WS-Resource.

- Define the means by which a service requestor can set an initial termination time for the scheduled termination of a WS-Resource.
- Define the means by which a service requestor can update the termination time associated with a WS-Resource that is scheduled for termination.
- Define the means by which a service requestor can determine the current termination time associated with a WS-Resource.

### 1.1.2 Non-Goals

The following topics are outside the scope of this specification:

- It is not an objective of this specification to define the message exchanges representing the function of a WS-Resource factory. Factory requirements are too varied to allow a general-purpose factory message exchange to be usefully defined. However, the factory pattern is described in more detail in [WS-Resource].

## 1.2 Notational Conventions

The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC 2119](#).

When describing abstract data models, this specification uses the notational convention used by the [XML Infoset]. Specifically, abstract property names always appear in square brackets (e.g., [some property]).

When describing concrete XML schemas, this specification uses the notational convention of [WS-Security]. Specifically, each member of an element's [children] or [attributes] property is described using an XPath-like notation (e.g., /x:MyHeader/x:SomeProperty/@value1). The use of {any} indicates the presence of an element wildcard (<xsd:any/>). The use of @{any} indicates the presence of an attribute wildcard (<xsd:anyAttribute/>).

## 1.3 Namespaces

The following namespaces are used in this document:

Prefix	Namespace
s12	http://www.w3.org/2003/05/soap-envelope
wsp	http://schemas.xmlsoap.org/ws/2002/12/policy
wsa	http://schemas.xmlsoap.org/ws/2003/02/addressing
wsnt	http://www.ibm.com/xmlns/stdwip/web-services/WS-Notification
wsrl (this spec)	http://www.ibm.com/xmlns/stdwip/web-services/WS-ResourceLifetime
xsd	http://www.w3.org/2001/XMLSchema

xsi	http://www.w3.org/2001/XMLSchema-instance
-----	---

## 2 Terminology and Concepts

This section specifies the notations, namespaces, and terminology used in this specification.

### **WS-Resource:**

- An identified stateful entity providing the “data context” for the execution of a message exchange implemented by a Web service.

### **WS-Resource Factory:**

- Any Web service responsible for the creation of a WS-Resource.

### **Implied Resource Pattern**

- The way WS-Addressing is used to associate a stateful resource with the execution of message exchanges implemented by a Web service.
- An EndpointReference that follows the implied resource pattern MUST include a ReferenceProperties child element that identifies the WS-Resource to be associated with the execution of all message exchanges performed using this EndpointReference.
- A message that follows the implied resource pattern MUST be sent to a Web service referred to by an EndpointReference that follows the implied resource pattern, and MUST include the ReferenceProperties information from that EndpointReference, as specified by WS-Addressing.
- A Web service that follows the implied resource pattern MUST use the ReferenceProperties information from a message that follows the implied resource pattern in order to identify the WS-Resource to associate with the execution requested by that message.

### **WS-Resource Qualified Endpoint Reference**

- An Endpoint Reference that associates a WS-Resource with a Web service.
- The identity of the WS-Resource MUST be contained within the ReferenceProperties element of the Endpoint Reference.
- The address of the Web service associated with the WS-Resource must be contained in the Address element of the Endpoint Reference.

### **Resource Property:**

- A resource property is a piece of information associated with the WS-Resource.
- A resource property may reflect a part of the resource’s state, meta-data, manageability information, etc.

### **Resource Properties Document:**

- The *logical* XML document representing a composition of resource property elements. The resource properties document defines a particular projection of the data associated with a WS-Resource.
- The *type* (e.g. the XML Schema definition of the root element) of a resource properties document is associated with the WSDL portType defining the Web service associated with the WS-Resource. All instances of a particular WS-

Resource type MUST be associated with a document of the type declared in the WSDL portType defining its associated Web service.

**Resource Property Element:**

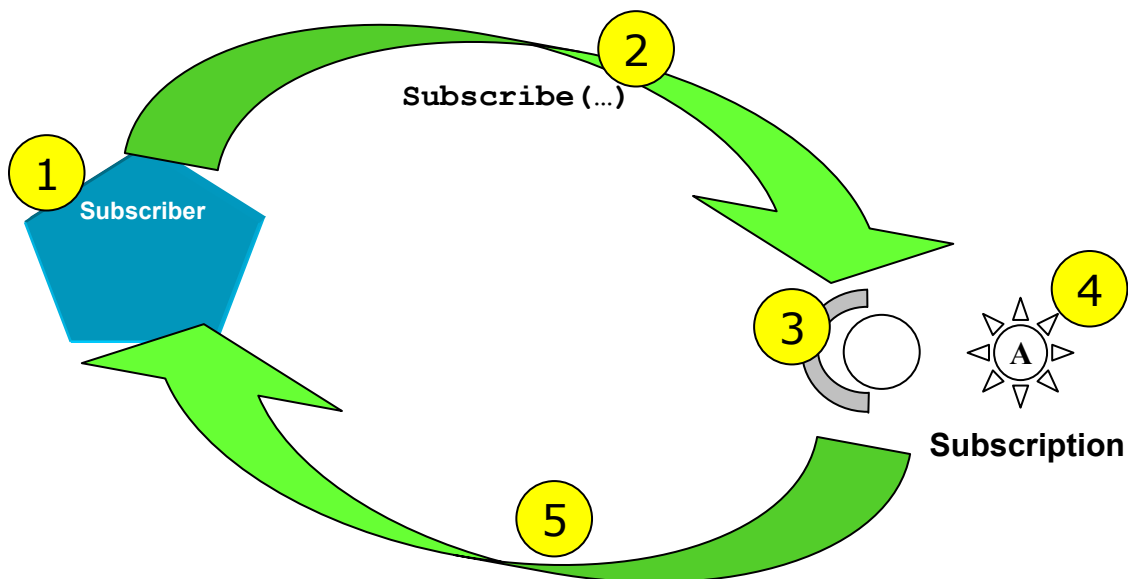

- The XML representation of a resource property.
- A resource property element must appear as the immediate child of the root element of a resource properties document.
- A resource property element must be an XML global element definition (GED), and is uniquely identified by QName.

**Resource Property Value:**

- The value(s) associated with a resource property.

### 3 Example

Consider the case of a subscription entity within a notification system such as WS-Notification [WS-Notification]. This situation is depicted in the following figure:

**Figure 1 - Example WS-Resource Creation**

A service requestor (1), playing the role of a subscriber, sends a subscribe message (2) to a NotificationProducer (3) because it wishes to receive notifications related to a particular situation such as a failure of a component. A subscription WS-Resource (4) is created as a result of the subscribe message, and a WS-Resource qualified EndpointReference (5) [WS-Resource] is returned to the requestor. As part of the application-specific understanding of the subscribe message exchange, both the requestor and provider understand that part of the semantic of processing a subscribe message is the creation (usually for a limited period of time) of a subscription WS-Resource. The subscribe request message contains the initial scheduled termination time of the subscription WS-Resource.

The endpoint reference that is returned as a result of the subscribe message is a WS-Resource qualified endpoint reference as described in [WS-Resource]. It contains a WS-Resource context that refers to the newly created subscription WS-Resource.

The endpoint reference also contains the address of a Web service that implements the message exchanges defined by WS-Notification's SubscriptionManager interface. Subsequent to the creation of the subscription resource, the application specific behavior of delivering notifications continues. Occasionally, the subscriber may examine the subscription resource using standard WS-ResourceLifetime resource properties to inquire about the remaining time before the subscription resource may be destroyed. If the subscriber wishes to extend the lifetime of the subscription beyond its scheduled termination time, it sends a specific WS-ResourceLifetime message to the service identified by the subscription's EndpointReference, prior to the expiration of its current scheduled termination time. The response to this message contains the (potentially unchanged) termination time associated with the subscription WS-Resource.

When the subscriber no longer wishes to receive notifications, it may cause the immediate destruction of the subscription WS-Resource by sending another WS-ResourceLifetime message to the service identified by the subscription's EndpointReference. As another option, it may simply allow the termination time of the subscription WS-Resource to expire, at which time the subscription WS-Resource may be destroyed.

## 4 Immediate Destruction

A Web service that implements the implied resource pattern [WS-Resource] MAY support a message exchange pattern that allows a service requestor to request the immediate destruction of a resource.

The format of the destroy request message is:

```
...  
<wsrsl:DestroyRequest />  
...
```

The DestroyRequest message MUST follow the implied resource pattern, as defined in Section 2.

If the Web service accepts the DestroyRequest message, upon receipt of this message the Web service MUST either (1) destroy the implied resource and return the following DestroyResponse message to acknowledge successful destruction of the resource, or (2) return a fault message indicating failure.

```
...  
<wsrsl:DestroyResponse />  
...
```

The receipt of the DestroyResponse message serves as a confirmation of the destruction of the WS-Resource. Once it has sent a DestroyResponse message, a Web service implementing the implied resource pattern MUST respond to any further message exchanges directed at the subject WS-Resource with a fault. In the absence of any other fault conditions that may take precedence this MUST be the "ResourceUnknown" fault message.

If the Web service does not respond to the DestroyRequest message with the DestroyResponse message, then it MUST send one of the following fault messages:

- ResourceUnknownFault
  - The resource identified in the message (which follows the implied resource pattern) is not associated with the Web service.

- ResourceNotDestroyedFault
  - The resource could not be destroyed for some reason.
- Others tbd.

#### 4.1 Example SOAP Encoding of the Destroy Message Exchange

The following is a non-normative example of a DestroyRequest message using SOAP 1.2 [SOAP 1.2]:

```
<s12:Envelope
  xmlns:s12="http://www.w3.org/2003/05/soap-envelope"
  xmlns:wsa="http://schemas.xmlsoap.org/ws/2003/03/addressing"
  xmlns:wsrl=
    "http://www.ibm.com/xmlns/stdwip/web-services/WS-ResourceLifetime"
  xmlns:ex="http://example.com/exampleNS">
  <s12:Header>
    <wsa:Action>
      http://www.ibm.com/xmlns/stdwip/web-services/WS-
ResourceLifetime/DestroyRequest
    </wsa:Action>
    <wsa:To s12:mustUnderstand="1">
      http://www.provider.org/ProviderEndpoint
    </wsa:To>
    <ex:ResourceId>
      uuid:84dec55-7d3f-65ad-ac44-675d9fce5d22
    </ex:ResourceId>
  </s12:Header>
  <s12:Body>
    <wsrl:DestroyRequest />
  </s12:Body>
</s12:Envelope>
```

The following is an example DestroyResponse message using SOAP 1.2 [SOAP 1.2]:

```
<s12:Envelope
  xmlns:s12="http://www.w3.org/2003/05/soap-envelope"
  xmlns:wsa="http://schemas.xmlsoap.org/ws/2003/03/addressing"
  xmlns:wsrl=
    "http://www.ibm.com/xmlns/stdwip/web-services/WS-ResourceLifetime"
  xmlns:resp="http://www.other.org/otherNS">
  <s12:Header>
    <wsa:Action>
      http://www.ibm.com/xmlns/stdwip/web-services/WS-
ResourceLifetime/DestroyResponse
    </wsa:Action>
    <wsa:To s12:mustUnderstand="1">
      http://www.requestor.org/someEndpoint
    </wsa:To>
    <resp:SomeResourceId>
      uuid:9fef5fec-6dc3-44a2-ba32-8680cace43f9
    </resp:SomeResourceId>
  </s12:Header>
  <s12:Body>
    <wsrl:DestroyResponse />
  </s12:Body>
</s12:Envelope>
```

## 5 Scheduled Destruction

A Web service MAY use a time-based approach for managing the destruction of its associated WS-Resources. In this case, the WS-Resource has an associated termination time that defines the time after which the WS-Resource is expected to be destroyed and thus before which the WS-Resource can reasonably be expected to be available. As defined in the following subsections, a WS-Resource's termination time may be inspected through the TerminationTime resource property, and may be changed using the SetTerminationTimeRequest message.

Typical use of scheduled destruction is to allow a service requestor to register its interest in keeping a WS-Resource alive by setting the WS-Resource's termination time to some appropriate time in the future with the SetTerminationTimeRequest message. Prior to that termination time, the requestor would extend its interest in the WS-Resource by sending another SetTerminationTimeRequest message with another time further in the future.

Note that termination time is not required to monotonically increase, nor is a service required to accept a requested termination time.

For the message exchanges defined in support of scheduled destruction, the time values are expressed as type `dateTime` from XML Schema. Note that `xsd:dateTime` includes an optional designation of a time zone. The use of the time zone designation is RECOMMENDED. In the absence of the time zone designation, the `xsd:dateTime` value MUST be interpreted as universal time (UTC) time.

If a Web service wishes to provide support for scheduled WS-Resource destruction, it MUST support all of the message exchanges and resource properties specified in this section.

### 5.1 Querying Current Time

In order to assist the service requestor in inspecting and setting a WS-Resource's termination time without requiring a specific accuracy of clock synchronization between the service requestor and the service provider, the WS-Resource MUST provide a resource property element that provides the current time as known by the Web service associated with the WS-Resource. The form of this resource property element is:

```
...  
<xsd:element name="CurrentTime" type="xsd:dateTime"/>  
...
```

The resource properties definition of the WS-Resource MUST contain exactly one element of QName `wsrl:CurrentTime`. The constraints on this element are as follows:  
`/wsrl:CurrentTime`

A Web service MUST NOT allow the `CurrentTime` resource property to be modified by a `SetResourcePropertiesRequest` message as defined in [WS-ResourceProperties].

If the element does not include the time zone designation, the value of the element MUST be interpreted as universal time (UTC) time.

### 5.2 Determining Current Termination Time

In order to allow the service requestor to determine the current termination time of a WS-Resource, the WS-Resource MUST provide a resource property element that

indicates the current termination time of the WS-Resource. The form of this resource property element is:

```
...  
<xsd:element name="TerminationTime" nillable="true"  
             type="xsd:dateTime" />  
...
```

The resource properties definition of the WS-Resource MUST contain exactly one element of QName `wsrl:TerminationTime`. The constraints on this element are as follows:

`/wsrl:TerminationTime`

The time, relative to the time source used by the Web service associated with the WS-Resource, after which the WS-Resource MAY be destroyed.

If the value of this resource property element contains the `xsi:nil` attribute with value "true" then the lifetime of the WS-Resource is considered to be *indefinite*; that is, there is no scheduled destruction time.

A Web service MUST NOT allow the `TerminationTime` resource property to be modified by a `SetResourcePropertiesRequest` message as defined in [WS-ResourceProperties].

If the element does not include the time zone designation, the value of the element MUST be interpreted as universal time (UTC) time.

### 5.3 Setting Initial Termination Time

When a WS-Resource is created through the use of a Web service acting as a WS-Resource factory, and the WS-Resource is subject to scheduled destruction, it is often desirable to allow the service requestor to specify an initial termination time for the WS-Resource being created as part of the creation request message. Any message request that intends to create a WS-Resource capable of participating in a scheduled destruction SHOULD include the following element as a component of the create request message:

```
...  
<xsd:element name="InitialTerminationTime" nillable="true"  
             type="xsd:dateTime" />  
...
```

The semantics of this message component are described as follows:

`/wsrl:InitialTerminationTime`

This value contains the suggested initial termination time of the WS-Resource(s) that will be created if the Web Service, acting as the factory, successfully processes the message. This time is relative to the time source used by the Web service executing the factory request. If the element does not include the time zone designation, the value of the element MUST be interpreted as universal time (UTC) time.

If the factory service is unable or unwilling to set the new WS-Resource's `TerminationTime` to that value or greater, then the factory operation request MUST fault.

If the value is not "in the future" relative to the service's current time, the factory operation request MUST fault.

The use of the `xsi:nil` attribute with value "true" indicates there is no scheduled termination time for the WS-Resource.

In the situation where the newly created WS-Resource does not support scheduled termination and an `InitialTerminationTime` is provided, the Web service processing the creation request message MAY ignore the `InitialTerminationTime` value.

## 5.4 Requesting Change to Termination Time

The `SetTerminationTimeRequest` message MUST be implemented by the service that supported scheduled destruction, in order to allow a requestor to change the scheduled termination time of a WS-Resource. The form of the `SetTerminationTimeRequest` message is:

```
<wsrl:SetTerminationTimeRequest>
  <wsrl:RequestedTerminationTime>
    xsd:dateTime
  </wsrl:RequestedTerminationTime>
</wsrl:SetTerminationTimeRequest>
```

The `SetTerminationTimeRequest` message MUST follow the implied resource pattern, as defined in Section 2.

Further constraints on the processing of the `SetTerminationTimeRequest` message are as follows:

`/wsrl:SetTerminationTimeRequest/wsrl:RequestedTerminationTime`

This is the new WS-Resource termination time that is being requested by the client. This value is interpreted relative to the time source used by the Web service associated with the implied WS-Resource. If the element does not include the time zone designation, the value of the element MUST be interpreted as universal time (UTC) time.

If the value is "in the past" relative to the service's current time, then the WS-Resource MAY be destroyed immediately.

If the value is `xsi:nil`, then the intent of the service requestor is to specify there is no scheduled termination time for the WS-Resource. In such situations it is RECOMMENDED that the Web service associated with the WS-Resource support the immediate resource destruction operations described in section 4.

The Web service that receives this message MAY reject the request to change the WS-Resource's termination time for any reason (e.g. policy). In this case, a fault message MUST be returned to the service requestor.

If a Web service accepts the request to set the WS-Resource's termination time, it MUST update the `TerminationTime` resource property of the WS-Resource to the value specified in the message or to a value "in the future" relative to the requested time. If the `SetTerminationTimeRequest` is accepted, the Web service MUST respond with the following message:

```
<wsrl:SetTerminationTimeResponse>
  <wsrl:NewTerminationTime>
    xsd:dateTime
  </wsrl:NewTerminationTime>
</wsrl:SetTerminationTimeResponse>
```

Further constraints on the `SetTerminationTimeResponse` message are as follows:

`/wsrl:SetTerminationTimeResponse/wsrl:NewTerminationTime`

This value MAY be "in the future" relative to the `xsd:dateTime` requested by the service requestor in the `SetTerminationTimeRequest` message.

This value reflects the new date and time at which the WS-Resource is scheduled to be destroyed.

This value MUST also be reflected through the value of the `TerminationTime` resource property.

In cases where the `SetTerminationTimeRequest` results in immediate destruction of the WS-Resource, the `SetTerminationTimeResponse` MUST have empty content and contain the attribute `xsi:nil` with the value "true", and the Web service MUST respond to any further message exchanges directed at the subject WS-Resource with a fault. In the absence of any other fault conditions that may take precedence this MUST be the "ResourceUnknown" fault message.

If the Web service does not respond to the `SetTerminationTimeRequest` message with the `SetTerminationTimeResponse` message, then it MUST send one of the following fault messages:

- `ResourceUnknownFault`
  - The resource identified in the message (which follows the implied resource pattern) is not associated with the Web service.
- `UnableToSetTerminationTimeFault`
  - The request for termination time could not be changed for some reason.
- `TerminationTimeChangeRejectedFault`
  - In the case where a Web service is willing to update the termination time of a WS-Resource, but only with a value "in the past" relative to the requested termination time, then the Web service MAY include a "hint" in the `TerminationTimeUnchangedFault` message indicating the time to which it is willing to extend `TerminationTime`.

## 5.5 Example SOAP Encoding of the `SetTerminationTime` Message Exchange

The following is a non-normative example of a `SetTerminationTimeRequest` message using SOAP 1.2 [SOAP 1.2]:

```
<s12:Envelope
  xmlns:s12="http://www.w3.org/2003/05/soap-envelope"
  xmlns:wsa="http://schemas.xmlsoap.org/ws/2003/03/addressing"
  xmlns:wsr="http://www.ibm.com/xmlns/stdwip/web-services/WS-ResourceLifetime"
  xmlns:ex="http://example.com/exampleNS">
  <s12:Header>
    <wsa:Action>
      http://www.ibm.com/xmlns/stdwip/web-services/WS-
ResourceLifetime/SetTerminationTimeRequest
    </wsa:Action>
    <wsa:To s12:mustUnderstand="1">
      http://www.provider.org/ProviderEndpoint
    </wsa:To>
    <ex:ResourceId>
      uuid:84dec55-7d3f-65ad-ac44-675d9fce5d22
    </ex:ResourceId>
```

```

</s12:Header>
<s12:Body>
  <wsrl:RequestedTerminationTime>
    2001-12-31T12:00:00
  </wsrl:RequestedTerminationTime>
</s12:Body>
</s12:Envelope>

```

The following is an example SetTerminationTimeResponse message using SOAP 1.2 [SOAP 1.2]:

```

<s12:Envelope
  xmlns:s12="http://www.w3.org/2003/05/soap-envelope"
  xmlns:wsa="http://schemas.xmlsoap.org/ws/2003/03/addressing"
  xmlns:wsrl="
    http://www.ibm.com/xmlns/stdwip/web-services/WS-ResourceLifetime"
  xmlns:resp="http://www.other.org/otherNS">
  <s12:Header>
    <wsa:Action>
      http://www.ibm.com/xmlns/stdwip/web-services/WS-
ResourceLifetime/SetTerminationTimeResponse
    </wsa:Action>
    <wsa:To s12:mustUnderstand="1">
      http://www.requestor.org/someEndpoint
    </wsa:To>
    <resp:SomeResourceId>
      uuid:9fef5fec-6dc3-44a2-ba32-8680cace43f9
    </resp:SomeResourceId>
  </s12:Header>
  <s12:Body>
    <wsrl:NewTerminationTime>
      2001-12-31T12:00:00
    </wsrl:NewTerminationTime>
  </s12:Body>
</s12:Envelope>

```

## 5.6 Termination Time Expiration

If the service requestor fails to successfully update the termination time of a WS-Resource before the termination time expires, the WS-Resource MAY be destroyed and therefore no longer be accessible through a service. Termination time has expired when the termination time of the resource (as reflected by the value of the resource's TerminationTime resource property element) is "in the past" relative to the current time as expressed in the value of the WS-Resource's CurrentTime resource property element.

The specific mechanisms employed to destroy the WS-Resource after termination time has expired is implementation dependent. An implementation MAY delay destruction of the resource at its own discretion. The requestor MUST not depend on the destruction of the resource occurring at termination time expiration but SHOULD assume that the WS-Resource is no longer accessible after termination time has expired.

## 6 Notification of Resource Destruction

If the Web service associated with the WS-Resource is also a NotificationProducer, according to the WS-Notification specification [WS-Notification], then it SHOULD provide a topic to allow requestors to subscribe for notification of the destruction of

the resource. The notification applies to both immediate and scheduled destruction. The form of the topic is:

```
<wsnt:topicSpace name="ResourceLifetime"
  targetNamespace=
    "http://www.ibm.com/xmlns/stdwip/web-services/WS-ResourceLifetime"
... >
  <wsnt:topic name="ResourceTermination">
```

The value of `/wsrp:ResourceTermination/@MessageTypes` is implementation dependent; this specification does not define the exact content of the notification messages produced on this topic. However, the notification message associated with this topic **MUST** contain the following element:

```
<wsrl:TerminationNotification>
  <wsrl:TerminationTime>xsd:dateTime</wsrl:TerminationTime>
  <wsrl:TerminationReason>xsd:any</wsrl:TerminationReason?>
</wsrl:TerminationNotification>
```

This element is further constrained as follows:

`/wsrl:TerminationTime`

This element contains the date and time when the resource was destroyed.

`/wsrl:TerminationReason`

This **OPTIONAL** element contains an explanation of the situation surrounding the destruction of the resource. This element is specific to the type of the resource that was destroyed.

A requestor would send a subscribe request message, following the WS-Notification specification, specifying the "ResourceTermination" topic and referencing a chosen WS-Resource using a referenceProperty element as specified in the implied resource pattern [WS-Resource].

## 7 Security Considerations

This specification defines the message exchanges using which a resource may be destroyed, or to obtain information about the resource termination time. In this context, there are two categories of security aspects that needs to be considered: (a) securing the message exchanges and (b) securing the operation that performs resource destruction.

### 7.1 Securing the Message Exchanges

When messages are exchanged between a requestor and a web service in order to access or act on the resource properties, it is strongly **RECOMMENDED** that the communication between services be secured using the mechanisms described in WS-Security. In order to properly secure messages, the body and all relevant headers need to be included in the digital signature so as to prove the integrity of the message. In addition the reference properties within an Endpoint Reference, passed during a subscribe operation, may be encrypted to ensure their privacy. In the event that a requestor communicates frequently with a Web service to access resource properties, either directly through a query or accomplished through notification of state change, it is **RECOMMENDED** that a security context be established using the mechanisms described in WS-Trust and WS-SecureConversation allowing for potentially more efficient means of authentication.

It is common for communication between requestors and web service front ending the resource to exchange multiple messages. As a result, the usage profile is such that it is susceptible to key attacks. For this reason it is strongly RECOMMENDED that the keys used to secure the channel be changed frequently. This "re-keying" can be effected a number of ways. The following list outlines four common techniques:

- Attaching a nonce to each message and using it in a derived key function with the shared secret
- Using a derived key sequence and switch "generations"
- Closing and re-establishing a security context
- Exchanging new secrets between the parties

It should be noted that the mechanisms listed above are independent of the security context token (SCT) and secret returned when subscribed the first time. That is, the keys used to secure the channel during notifications may be independent of the key used to prove the right to subscribe with a NotificationSource.

The security context MAY be re-established using the mechanisms described in WS-Trust and WS-SecureConversation. Similarly, secrets can be exchanged using the mechanisms described in WS-Trust. Note, however, that the current shared secret SHOULD NOT be used to encrypt the new shared secret. Derived keys, the preferred solution from this list, can be specified using the mechanisms described in WS-SecureConversation.

The following list summarizes common classes of attacks that apply to this protocol and identifies the mechanism to prevent/mitigate the attacks:

- **Message alteration** – Alteration is prevented by including signatures of the message information using WS-Security.
- **Message disclosure** – Confidentiality is preserved by encrypting sensitive data using WS-Security.
- **Key integrity** – Key integrity is maintained by using the strongest algorithms possible (by comparing secured policies – see WS-Policy and WS-SecurityPolicy).
- **Authentication** – Authentication is established using the mechanisms described in WS-Security and WS-Trust. Each message is authenticated using the mechanisms described in WS-Security.
- **Accountability** – Accountability is a function of the type of and string of the key and algorithms being used. In many cases, a strong symmetric key provides sufficient accountability. However, in some environments, strong PKI signatures are required.
- **Availability** – Many services are subject to a variety of availability attacks. Replay is a common attack and it is RECOMMENDED that this be addressed as described in the next bullet. Other attacks, such as network-level denial of service attacks are harder to avoid and are outside the scope of this specification. That said, care should be taken to ensure that minimal processing be performed prior to any authenticating sequences.
- **Replay** – Messages may be replayed for a variety of reasons. To detect and eliminate this attack, mechanisms should be used to identify replayed messages such as the timestamp/nonce outlined in WS-Security and the sequences outlined in WS-ReliableMessaging.

## 7.2 Securing Resource Destruction

Given WS-ResourceLifetime allows a mechanism to destroy resources, security policies should be established that ensure that only authorized requesters can destroy a resource. Authorization policies should be defined so that the implications of destroying a resource either through immediate requests or by setting termination time are considered. The two approaches for destruction may be considered equivalent for authorization reasons. In other words, an authorization policy that describes the ability to perform Destroy operation on a resource, conforming to ImmediateResourceTermination portType, may need to be applied when the SetTerminationTime operation is performed on the same resource.

Security policies can be set at the granularity of a portType thus allowing authorized users to be able to destroy any resource conforming to the portType – this can be useful in scenarios involving system identities performing implicit destruction or administrators performing explicit destruction. It is desired that policies should be set at the level of granularity of resource in a way that identity of a resource as specified in policy is equivalent to the identity of the resource as contained in the referenceProperties of WS-Addressing header.

It should be noted that this specification does not allow modifications to (a) CurrentTime, (b) TerminationTime, resource properties through SetResourceProperty request message of WS-ResourceProperties. Therefore, there should be no authorization enforcement performed when these properties are accessed using the Set request message but leave it to the runtime to enforce the requirement as specified. Given a requestor can subscribe for notification of the destruction of the resource using, "ResourceLifetime" topic, the security considerations specified in WS-Notification specification are applicable to this topic.

## 8 Acknowledgements

Special thanks to the Global Grid Forum's Open Grid Services Infrastructure working group, which defined the OGSI v1.0 [OGSI] specification which was a large inspiration for the ideas expressed in this specification.

This specification has been developed as a result of joint work with many individuals and teams. The authors wish to acknowledge the contributions from many people, including: Dave Booz, Rob High, Jim Knutson, and Jay Unger.
