XACML profile for Web-services

Working draft 04, 29 Sep 2003

Document identifier: draft-xacml-wspl-04

Location: http://www.oasis-open.org/committees/documents.php?wg_abbrev=xacml

Send comments to: xacml-comment@lists.oasis-open.org

Simon Godik, Overxeer

Abstract:

This working draft specifies a profile of XACML for expressing policy associated with Web-service end-points.

Status:

This version of the specification is a working draft of the committee. As such, it is expected to change prior to adoption as an OASIS standard.

If you are on the xacml@lists.oasis-open.org list for committee members, send comments there. If you are not on that list, subscribe to the xacml-comment@lists.oasis-open.org list and send comments there. To subscribe, send an email message to xacml-comment-request@lists.oasis-open.org with the word "subscribe" as the body of the message.

Table of contents

1. Introduction (non-normative)

1.1 Glossary

Aspect – An independent set of technical features and parameters associated with use of a Web-service. In most cases, an **aspect** is identified with a single member of the suite of Web-service specifications for which policy provisions must be described, such as WS-Reliable Messaging or WS-Security. In the former case, policy provisions may include such items as: maximum time to live, maximum number of retries and minimum interval between retries.

Authorized attribute – An attribute whose value must be assigned by an authority, not a policy-user.

Coincidence – The property of pairs of **predicates**, **strategies**, **objectives** and **end-point policies** that enables them to be combined.

Combiner – An entity that combines two or more **end-point policies**.

Constrained attribute - An attribute whose value cannot be assigned by the policy-user.

End-point policy – 1. The set of provisions governing all **aspects** of a Web-service end-point. 2. A conjunctive set of **objectives**. 3. An XACML `<PolicySet>` element.

Objective – 1. The set of provisions governing a single **aspect** of a Web-service end-point. 2. A disjunctive list of **strategies**, in order of preference. 3. An XACML `<Policy>` element.

Solution – The set of features and parameter values that satisfy an end-point's requirements for successful invocation.

Strategy – 1. One **solution** to a single **aspect** of a Web-service end-point. 2. A conjunctive set of **predicates**. 3. An XACML `<Rule>` element.

Unconstrained attribute - An attribute whose value can be assigned by the policy-user within a certain range

1.2 Notation

This specification contains schema conforming to W3C XML Schema and normative text to describe the syntax and semantics of XML-encoded policy statements.

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this specification are to be interpreted as described in IETF RFC 2119 **[RFC2119]**

"they MUST only be used where it is actually required for interoperation or to limit behavior which has potential for causing harm (e.g., limiting retransmissions)"

These keywords are thus capitalized when used to unambiguously specify requirements over protocol and application features and behavior that affect the interoperability and security of implementations. When these words are not capitalized, they are meant in their natural-language sense.

```
Listings of schemas appear like this.
```

```
Example code listings appear like this.
```

Conventional XML namespace prefixes are used throughout the listings in this specification to stand for their respective namespaces as follows, whether or not a namespace declaration is present in the example:

The prefix `xacml:` stands for the XACML policy namespace.

The prefix `xs:` stands for the W3C XML Schema namespace **[XS]**.

The prefix `xf:` stands for the XQuery 1.0 and XPath 2.0 Function and Operators specification namespace **[XF]**.

This specification uses the following typographical conventions in text: `<XACMLElement>`, `<ns:ForeignElement>`, `Attribute`, **Datatype**, `OtherCode`. Terms in ***italic bold-face*** are intended to have the meaning defined in the Glossary of this document or **[XACML v1.0]**.

1.3 Schema organization and namespaces

The XACML policy syntax is defined in a schema associated with the following XML namespace:

```
urn:oasis:names:tc:xacml:1.0:policy
```

1.4 Background

Access to a standard-conformant Web-service end-point involves a number of **aspects**, such as: reliable messaging, privacy, authorization, trust, authentication and cryptographic security. Each **aspect** addresses a number of optional features and parameters, which must be coordinated between communicating end-points if the service invocation is to be successful. The provider and consumer of the service likely have different preferences amongst the available choices of features and parameters. Therefore, a mechanism is required by which end-points may describe the mandatory features of service invocation, optional features that they support and the order of their preference amongst such features. Additionally, a procedure is required for combining and reducing these feature descriptions into a service invocation instance that respects both end-points' requirements. These requirements are explained in **[WSPL Req]**.

This specification defines a profile of XACML that enables it to be used for describing policy associated with Web-service end-points and using them in a successful invocation.

2. Model (Normative)

In this profile, an XACML `<PolicySet>` element is associated with a concrete Web-service end-point definition. To that end, its `<Target>` element MUST identify the WSDL 1.1 port whose features and parameters it describes. In the case that a policy must be targeted more finely than a port, a second level of `<PolicySet>` whose `<Target>` element identifies the port's operations and messages MUST be inserted. The `<PolicySet>` elements MUST contain `<Policy>` elements that define the **objective** of each **aspect** of policy associated with the port.

An XACML <Policy> element is associated with a single **aspect** of an **end-point policy**. The <Target> element of a <Policy> MUST identify the one **objective** of the **end-point policy** to which it applies. Developers of Web-service specifications that make use of XACML MUST define a name and type for its **objective**. In order for an end-point to be successfully invoked, all of its **objectives** MUST be achieved by the service invocation. The <Policy> element MUST contain <Rule> elements that define acceptable alternative **strategies** for achieving the **objective**.

An XACML <Rule> element MUST describe one alternative **strategy** for achieving an **objective**. At least one **strategy** MUST be successful if its **objective** is to be achieved. The lexical order of the **strategies** in the **objective** SHOULD reflect the policy-writer's preferences. For example, the policy writer's preferred **strategy** should appear first. The <Rule> element MUST contain a set of <Apply> elements that define **predicates**.

An XACML <Apply> element MUST contain exactly one **predicate**. All **predicates** MUST be satisfied by a service invocation if the associated **strategy** is to be successful.

An <Apply> element SHALL NOT contain another <Apply> element. It is RECOMMENDED that <Apply> elements be structured as follows:

```
<Apply functionId="…">
  <AttributeSelector RequestContextPath="…" DataType="…"/>
  <AttributeValue DataType="…"> … </AttributeValue>
</Apply>
```

In cases where the policy constrains the *relationship between **attribute*** values, as opposed to the *literal value of* an ***attribute***, it will be necessary to substitute a second <AttributeSelector> element for the <AttributeValue> element in the above fragment. The order of the <AttributeSelector> element and the <AttributeValue> element in the above fragment MAY be reversed to achieve the required constraint if the applied function has no inverse (e.g. subset). Any of the following elements MAY be used in place of the <AttributeSelector> element in either position: <SubjectAttributeDesignator>, <ResourceAttributeDesignator>, <ActionAttributeDesignator> or <EnvironmentAttributeDesignator>.

The relevant portion of the WSDL 1.1 data model is hierarchical, as shown in Figure 1.

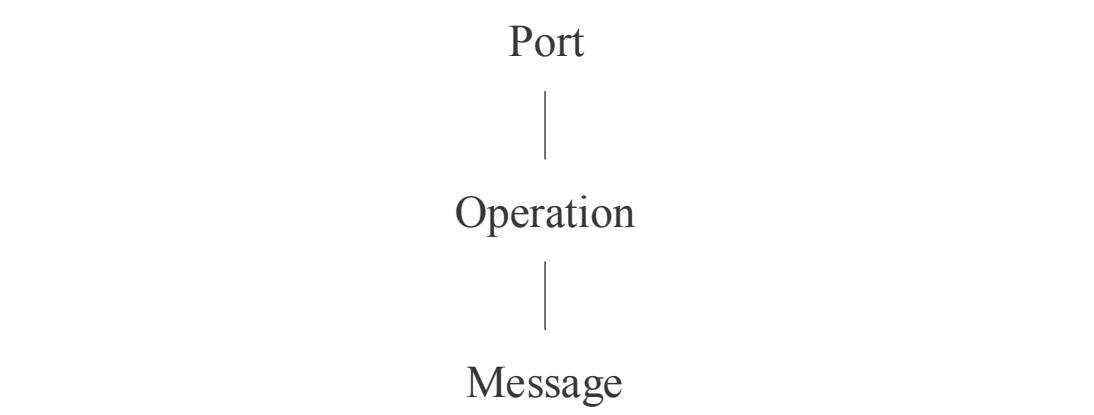

Figure 1 - WSDL 1.1 hierarchical data model

This structure is reflected in the **end-point policy** model, as shown in Figure 2.

The `name` attribute values of objects in the WSDL 1.1 model SHALL be used in `<Target>` elements of the **end-point policy** to associate policy statements with those objects. The `names` SHALL be matched using string equality. Nevertheless, a `<Target>` element used to associate a policy statement with a non-root object in the WSDL 1.1 model is intended to identify the object within the context established by the `<Target>` elements of its enclosing `<PolicySet>` element(s). So, target matching SHALL be performed on the set of objects that has been successively refined by the enclosing layers of the **end-point policy**.

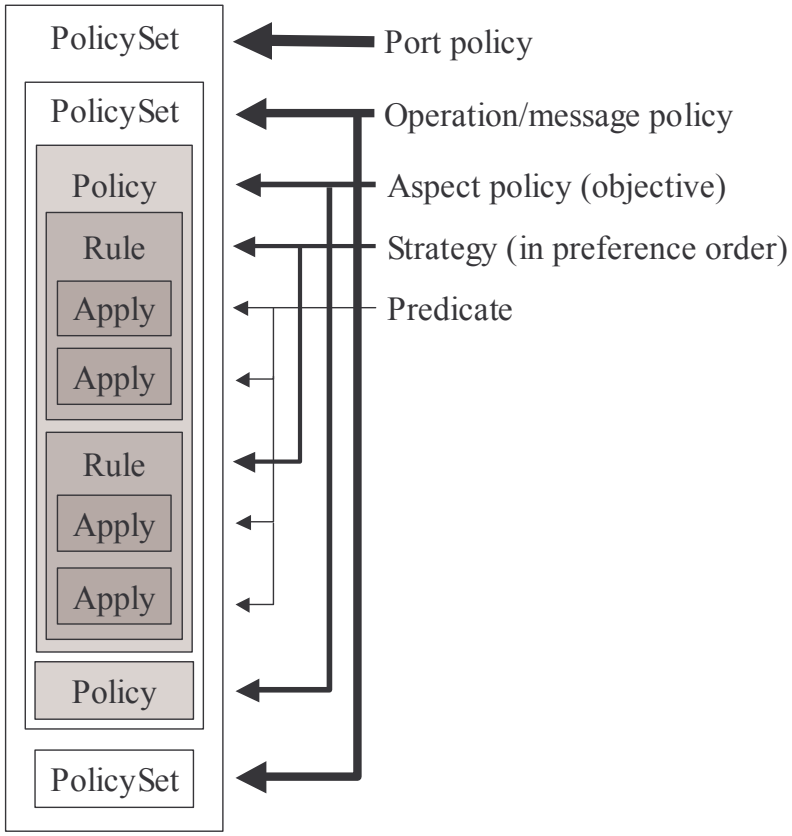

Figure 2 – End-point policy model

This model has been chosen to facilitate combining of **end-point policies**.

The following consequences flow from the model:

The policy-combining algorithm for `<PolicySet>` elements SHALL be "urn:oasis:names:tc:xacml:1.0:policy-combining-algorithm:deny-overrides".

The contents of all `<PolicySet/Target/Subjects>` elements SHALL be `<AnySubject/>`.

The contents of the top-level `<PolicySet/Target/Resources>` element SHALL be the `name` attribute of the end-point's port definition.

The `MatchId` for the `<PolicySet/Target/Resources>` element SHALL be "urn:oasis:names:tc:xacml:1.0:function:string-equal".

The contents of the top-level <PolicySet/Target/Actions> element SHALL be <AnyAction/>.

If present, the contents of the second-level <PolicySet/Target/Resources> element SHALL either be the name attribute of the end-point's message definition or the element <AnyResource/>.

In the case that the <PolicySet/Target/Resources> element is the name attribute, the MatchId SHALL be "urn:oasis:names:tc:xacml:1.0:function:string-equal".

If present, the contents of the second-level <PolicySet/Target/Actions> element SHALL be the name attribute of the end-point's operation definition or the element <AnyAction/>.

In the case that the <PolicySet/Target/Actions> element is the name attribute, the MatchId SHALL be "urn:oasis:names:tc:xacml:1.0:function:string-equal".

If the contents of the second-level <PolicySet/Target/Resources> element is the element <AnyResource/>, then the contents of the <PolicySet/Target/Actions> element SHALL NOT be the element <AnyAction/>, and vice-versa. Otherwise, its <Policy> elements should be placed immediately subordinate to the top-level <PolicySet> element.

The rule-combining algorithm for a <Policy> element SHALL be "urn:oasis:names:tc:xacml:1.0:rule-combining-algorithm:permit-overrides".

The MatchId for the <Policy/Target/Resources> element SHALL be "urn:oasis:names:tc:xacml:1.0:function:anyURI-equal".

The Effect attribute of all <Rule> elements SHALL be "Permit".

The contents of the <Policy/Target/Subjects> element SHALL be <AnySubject/>.

The contents of the <Policy/Target/Resources> element SHALL be <AnyResource/>.

The contents of the <Policy/Target/Actions> element SHALL identify the **objective** (see Section [a01]).

The <Rule/Target> element SHALL be omitted.

The FunctionId attribute of a <Condition> element SHALL be "urn:oasis:names:tc:xacml:1.0:function:and".

The FunctionId attribute of an <Apply> element SHALL identify one of the matching functions specified in XACML.

In order to be considered conformant with this profile, a <PolicySet> element MUST satisfy all of these conditions.

Predicates express constraints on **attributes**. **Attributes** fall into three classes:

Unconstrained attributes,

Constrained attributes and

Authorized attributes.

An **unconstrained attribute** is one whose value can be assigned by the policy-user. For instance, the minimum time between re-transmissions of an unacknowledged message is an **attribute** that should be under the control of the sender (within certain limits). This is, therefore, in the class of **unconstrained attributes**.

A **constrained attribute**, on the other hand, is one whose value is outside the control of the policy-user. This may be because it is an environmental **attribute** or a subject **attribute** whose value is assigned by someone other than the policy-user. The emergency condition code is an example of an environmental **attribute** over which a policy-user has no control; if this **attribute** is used in a **predicate**, then the **predicate** either evaluates “True” or “False”, regardless of any action that the policy-user might take. An example of a subject **attribute** over which the policy-user has no control is his or her status in a customer loyalty program. If this **attribute** is used in a **predicate**, then the **predicate** either evaluates “True” or “False”, regardless of any action that the policy-user might take. Some **constrained attributes** vary with time either in a predictable or unpredictable manner. In the case of the environmental **attribute** “time”, it will never again adopt values in the past, whereas, values in the future will arise in a predictable manner. In this case, the policy-user may choose to wait until the **predicate** involving time evaluates “True”.

An **authorized attribute** is one whose value has to be asserted by an authority, for instance the policy-user’s role. While the other party will not accept the policy-user’s own assertion that he or she occupies a particular role, the policy-user may be able to take action to obtain the necessary assertion about the **attribute** from a suitable authority.

---

3. Example (Non-normative)

This section contains an example of a service-provider policy on the **aspect** of data-rate allocation.

Here is a plain-language description of the policy.

> Clients paying ¢150/minute are allocated a guaranteed minimum data-rate of 64kb/s.
>
> Clients paying ¢45/minute are allocated a guaranteed minimum data-rate between 6pm and midnight of 40kb/s.

In order to make the example somewhat easier to read, several abbreviations have been introduced. For instance:

> The `<Subjects>` element has been omitted from all the `<Target>` elements.
>
> Only `<*Match>` elements have been retained in `<Target>` elements.
>
> URIs have been abbreviated.
>
> "*one-and-only" bag functions have been omitted around `<AttributeDesignator>` elements in `<Condition>` elements.
>
> `DataType` and `FunctionId` prefixes have been omitted. A reader familiar with XACML should be able to reconstruct a syntactically correct policy from the information provided.

```
[a01]  <PolicySet PolicySetId="A1UdAQQ8MDqAEEVs" PolicyCombiningAlgId="deny-
       overrides">
[a02]    <Target>
[a03]      <Resources>
[a04]        <ResourceMatch MatchId="equal"
[a05]          <AttributeValue DataType="anyURI">
[a06]            serviceX:portX
[a07]          </AttributeValue>
```

```
[a08]         <ResourceAttributeDesignator AttributeId=
      "urn:oasis:names:tc:xacml:1.0:attribute:portId" DataType="anyURI"/>
[a09]       </ResourceMatch>
[a10]     </Resources>
[a11]     <Actions>
[a12]       <AnyAction/>
[a13]     </Actions>
[a14]   </Target>
[a15]   <Policy PolicyId="A1UdAQQ8MDqAEEVt" RuleCombiningAlgId="permit-
      overrides">
[a16]     <Target>
[a17]       <Actions>
[a18]         <ActionMatch MatchId="equal">
[a19]           <AttributeValue DataType="anyURI">
[a20]             data-rate-allocation
[a21]           </AttributeValue>
[a22]           <ActionAttributeDesignator AttributeId=
      “urn:oasis:names:tc:xacml:1.0:attribute:objectiveId" DataType="anyURI"/>
[a23]         </ActionMatch>
[a24]       </Actions>
[a25]     </Target>
[a26]     <Rule RuleId="A1UdAQQ8MDqAEEVu" Effect="Permit">
[a27]       <Condition FunctionId="and">
[a28]         <Apply FunctionId="equal">
[a29]           <SubjectAttributeDesignator DataType="integer" AttributeId="fee"/>
[a30]           <AttributeValue DataType="integer">
[a31]             150
[a32]           </AttributeValue>
[a33]         </Apply>
[a34]         <Apply FunctionId="greater-than-or-equal">
[a35]           <ResourceAttributeDesignator DataType="integer" AttributeId="data-
      rate"/>
[a36]           <AttributeValue DataType="integer">
[a37]             64000
[a38]           </AttributeValue>
[a39]         </Apply>
[a40]       </Condition>
[a41]     </Rule>
[a42]     <Rule RuleId="A1UdAQQ8MDqAEEVv" Effect="Permit">
[a43]       <Condition FunctionId="and">
[a44]         <Apply FunctionId="equal">
[a45]           <SubjectAttributeDesignator DataType="integer" AttributeId="fee"/>
[a46]           <AttributeValue DataType="integer">
[a47]             45
[a48]           </AttributeValue>
[a49]         </Apply>
[a50]         <Apply FunctionId="equal">
[a51]           <ResourceAttributeDesignator DataType="integer" AttributeId="data-
      rate"/>
[a52]           <AttributeValue DataType="integer">
```

```
[a53]            40000
[a54]           </AttributeValue>
[a55]         </Apply>
[a56]         <Apply FunctionId="greater-than-or-equal">
[a57]           <EnvironmentAttributeDesignator DataType="time"
          AttributeId="timeOfDay"/>
[a58]           <AttributeValue DataType="time">
[a59]             18:00
[a60]           </AttributeValue>
[a61]         </Apply>
[a62]       </Condition>
[a63]     </Rule>
[a64]   </Policy>
[a65] </PolicySet>
```

Line [a01] indicates that all `<Policy>` elements within the `<PolicySet>` element must evaluate "True". I.e. all **objectives** must be satisfied.

Lines [a03] – [a10] match the `<PolicySet>` element to the port whose `portId` is "serviceX:portX".

There is no second-level `<PolicySet>` element. So, the `<PolicySet>` element applies to all operations and messages of that port.

Line [a15] indicates that at least one of the `<Rule>` elements within the `<Policy>` element must evaluate "True". I.e. at least one **strategy** must be successful.

Lines [a18] – [a24] match the `<Policy>` element to the **objective** whose `objectiveId` is "data-rate-allocation".

Lines [a26] – [a27] contain the first **strategy**, which contains two **predicates**, each one of which must evaluate "True".

Lines [a29] – [a33] contain the first of the two **predicates**. It evaluates "True" if the fee paid is ¢150/minute.

Lines [a42] – [a63] contain the second **strategy**, which contains three **predicates**.

4. Instructions to standards developers

Developers of Web-services standards that are intended to conform with this profile MUST define standard-specific policy parameters.

4.1 Procedure (Normative)

Developers of Web-services standards MUST complete the following steps.

Assign a URI for at least one `objectiveId` attribute. In the event that the specification document-identifier is a URI, it MAY be used as the `objectiveId` URI.

Define a set of **attribute** names, types and semantics. Classify the **attributes** as unconstrained, constrained or authorized.

Select one or more matching functions on the **attributes** from the matching functions defined in **[XACML]**. The functions MUST be type-consistent with the **attributes**. For every individual **attribute**, its associated matching functions MUST be combinable, as defined in Table 1. It is STRONGLY RECOMMENDED to use type-greater-than-or-equal or type-less-than-or-equal matching functions in preference to type-greater-than or type-less-than matching functions, respectively. If it is, nonetheless, necessary to use type-greater-than or type-less-than matching functions, then ceiling and floor operations (respectively) MUST be defined for the corresponding **attribute**. This merely involves defining a resolution for the **attribute** value. For instance, the **attribute** "minimum time between re-transmissions of an unacknowledged message" may be assigned a resolution of 1 minute. Then, if this **attribute** were to be used as the second operand in a duration-greater-than function, the ceiling operation on this **attribute** would return the shortest value greater than the specified value with a resolution of 1 minute.

These attributes and functions MAY be used in **predicates**.

4.2 Example (Non-normative)

A committee defining the reliable messaging **aspect** of Web-service invocation might assign the URI:

urn:oasis:names:tc:wsrm:1.0:objectiveId

as the `objectiveId`.

It might identify the maximum-time-to-live **attribute** as a parameter of policy. It might assign the identifier:

urn:oasis:names:tc:wsrm:1.0:maximum-time-to-live

to this ***attribute***. Then it might identify the ***attribute*** type to be

http://www.w3.org/TR/2002/WD-xquery-operators-20020816#DayTimeDuration.

It might define its meaning to be the maximum value permitted to be assigned by the requestor to the "time-to-live" parameter associated with a service request. Because the **attribute** value can be assigned by the requestor, this is an **unconstrained attribute**.

Then it might identify

urn:oasis:names:tc:xacml:1.0:function:dateTime-less-than-or-equal

as the matching function associated with the **attribute**. Because this function is neither a type-greater-than nor a type-less-than matching function, there is no need to define a ceiling or floor operation.

The committee MUST specify all relevant parameters in a similar way.

5. Definitions (Normative)

This profile defines the following **attributes**.

5.1 Attribute objectiveId

Name: urn:oasis:names:tc:xacml:1.0:attribute:objectiveId.

Type: xs:anyURI.

Meaning: the value of this **attribute** indicates the **aspect** of policy addressed by a `<Policy>` element. The `Policy/Target/Actions/ActionMatch/ActionAttributeDesignator/@AttributeId` attribute MUST be assigned this value.

5.2 Attribute portId

Name: urn:oasis:names:tc:xacml:1.0:attribute:portId.

Type: xs:anyURI.

Meaning: the value of this **attribute** identifies the `WSDL port` addressed by a `<PolicySet>` element. The `PolicySet/Target/Resources/ResourceMatch/ResourceAttributeDesignator/@AttributeId` attribute MUST be assigned this value.

5.3 Attribute operationId

Name: urn:oasis:names:tc:xacml:1.0:attribute:operationId.

Type: xs:anyURI.

Meaning: the value of this **attribute** identifies the `WSDL operation` addressed by a second-level `<PolicySet>` element. The `PolicySet/Target/Actions/ActionMatch/ResourceAttributeDesignator/@AttributeId` attribute MUST be assigned this value.

5.4 Attribute messageId

Name: urn:oasis:names:tc:xacml:1.0:attribute:messageId.

Type: xs:anyURI.

Meaning: the value of this **attribute** identifies the `WSDL message` addressed by a second level `<PolicySet>` element. The `PolicySet/Target/Resources/ResourceMatch/ResourceAttributeDesignator/@AttributeId` attribute MUST be assigned this value.

6. End-point policy combination (Normative)

The need to combine two or more policies is described in **[WSPL Req].**

The procedure for combining two top-level <PolicySet> elements is described here. More than two <PolicySet> elements MAY be combined by repeating this procedure. Alternative procedures that achieve the same result under all circumstances SHALL be considered conformant.

The combining procedure involves combining **coincident** top-level <PolicySet> elements, then combining **coincident** second-level <PolicySet> elements within the combined top-level <PolicySet> elements, then combining **coincident** <Policy> elements within the combined <PolicySet> elements, then combining **coincident** <Rule> elements within the combined <Policy> elements and finally combining **coincident** <Apply> elements within the combined <Rule> elements. Finally, elimination and substitution steps are applied.

The detailed steps are described below.

The effect of this procedure is to identify a single <Rule> element for each **objective** that represents the contract between the parties. The contract is compatible with both of the original **end-point policies**, while reflecting the preferences of the **combiner**.

6.1 Combine top-level <PolicySet> elements

Combine **coincident** top-level <PolicySet> elements. <PolicySet> elements are **coincident** if and only if their <Target> elements are identical.

In order to combine two top-level <PolicySet> elements, append the foreign <Policy> and second-level <PolicySet> elements to the **combiner's** <Policy> and second-level <PolicySet> elements and assign a new unique PolicySetId attribute.

6.2 Combine second-level <PolicySet> elements

If second-level <PolicySet> elements are present, then all **coincident** pairs of these MUST be combined in the same way. If a second-level <PolicySet/Target/Resources> element contains the <AnyResource/> element, then it is **coincident** with another second-level <PolicySet> element if and only if their <Target/Actions> elements are identical. The converse is the case if the <AnyAction> element is present.

If one top-level <PolicySet> element contains a second level <PolicySet> element and the other one does not, then the one that does not SHALL be treated as if it were to contain a second-level <PolicySet> element whose <PolicySet/Target/Resources> element contains the <AnyResource/> element and whose <PolicySet/Target/Actions> element contains the <AnyAction/> element.

6.3 Combine <Policy> elements

Within the resulting <PolicySet> elements, combine all **coincident** <Policy> elements. <Policy> elements are **coincident** if and only if their <Target> elements are identical.

In order to combine two <Policy> elements, append the foreign <Rule> elements to the **combiner's** <Rule> elements and assign a new unique PolicyId attribute.

6.4 Combine <Rule> elements

Within each resulting <Policy> element, combine <Rule> elements in all possible pairings, taking one from the **combiner's** set and one from the foreign set. The **combiner's** first <Policy> element SHOULD be paired with each of the foreign <Policy> elements, starting with the first, then the **combiner's** second <Policy> element SHOULD be paired with each of the foreign <Policy> elements, etc.. This procedure respects the preferences of each policy writer, while giving priority to those of the **combiner**.

In order to combine two <Rule> elements, append the <Apply> elements from the foreign <Rule> element to the **combiner's** <Apply> elements and assign a new unique RuleId attribute.

6.5 Combine <Apply> elements

Within each resulting <Rule> element, combine all **coincident** <Apply> elements. <Apply> elements are **coincident** if they constrain the same **attribute**. If there exists no **attribute** value for which both <Apply> elements evaluate to "True", then their **strategies** are incompatible and the <Rule> element MUST be discarded. The test for compatible strategies is shown in the third column of Table 1. If no <Rule> elements remain, then the procedure SHALL terminate in failure. Note that in the case where the same **attribute** is constrained by different **aspects**, this procedure will not detect incompatible constraints.

Coincident <Apply> elements SHALL be combined as shown in the fourth column of Table 1.

Table 1 is to be interpreted according to the following key.

Columns one, two and four contain shorthand versions of an XACML <Apply> element. The portion before the open parenthesis (e.g. "type-equal" in the first row) represents the <Apply> element's FunctionId attribute value. The "type-" portion represents any of the type-specific parts of the standard XACML function identifiers.

Alphabetic symbols (e.g. "a" in the first row) represent XACML <AttributeDesignator>, <AttributeSelector> or <AttributeValue> elements.

Where N/A appears in the fourth column there is no single replacement <Apply> element: the **predicates** are compatible, but not combinable. In these cases, the original <Apply> elements MUST NOT be modified by this step in the procedure.

∩ means set intersection.

⊆ means "is a proper subset of".

	First <Apply> element	Second <Apply> element	Compatible strategies	Replacement <Apply> element
1	type-equal(a,b)	type-equal(a,c)	b == c	type-equal(a,b)
2	type-equal(a,b)	type-greater-	b > c	type-equal(a,b)

		than(a,c)			
3	type-equal(a,b)	Type-greater-than-or-equal(a,c)	b ≥ c	type-equal(a,b)	
4	type-equal(a,b)	type-less-than(a,c)	b < c	type-equal(a,b)	
5	type-equal(a,b)	type-less-than-or-equal(a,c)	b ≤ c	type-equal(a,b)	
6	type-greater-than(a,b)	type-greater-than(a,c)		type-greater-than(a,max(b,c))	
7	type-greater-than(a,b)	type-greater-than-or-equal(a,c)		Where b ≥ c	type-greater-than(a,b)
8				Where b < c	type-greater-than-or-equal(a,c)
9	type-greater-than-or-equal(a,b)	type-greater-than-or-equal(a,c)		type-greater-than-or-equal(a,max(b,c))	
10	type-less-than(a,b)	type-less-than(a,c)		type-less-than(a,min(b,c))	
11	type-less-than(a,b)	type-less-than-or-equal(a,c)		Where b > c	type-less-than-or-equal(a,c)
12				Where b ≤ c	type-less-than(a,b)
13	type-less-than-or-equal(a,b)	type-less-than-or-equal(a,c)		type-less-than-or-equal(a,min(b,c))	
14	type-greater-than(a,b)	type-less-than(a,c)	b < c	N/A	
15	type-greater-than(a,b)	type-less-than-or-equal(a,c)	b < c	N/A	
16	type-greater-than-or-equal(a,b)	type-less-than(a,c)	b < c	N/A	
17	type-greater-than-or-equal(a,b)	type--less-than-or-equal(a,c)	b < c	N/A	
18	set-equals(a,b)	set-equals(a,c)	b == c	set-equals(a,b)	
19	set-equals(a,b)	subset(a,c)	b ⊆ c	set-equals(a,b)	
20	subset(a,b)	subset(a,c)	∩ (b,c) ≠ 0	subset (a,∩ (b,c))	

436 **Table 1 - Predicate combination**

6.6 Eliminate <Rule> elements

Following combination, an elimination step MUST be applied. The <Rule> elements represent the available ***strategies*** in order of preference for each ***aspect***. Ideally, the policy-user would adopt the first <Rule> element as its ***strategy*** for invoking the service. However, some ***strategies*** may place constraints on ***attributes*** that are not within the control of the policy-user. Such strategies MUST be eliminated.

Elimination proceeds by examining each <Apply> element, as described below.

1. If the <Apply> element places a literal constraint on a ***constrained attribute***, then the policy-user SHALL test whether the constraint is satisfied by the ***attribute***. If it is, then it SHALL proceed. If it is not, then the enclosing <Rule> element SHALL be eliminated.
2. If the <Apply> element places a literal constraint on an ***unconstrained attribute***, then the policy-user SHALL assign a value to the ***attribute*** that satisfies the constraint. If the required value is not in the available range, then the enclosing <Rule> element SHALL be eliminated.
3. If the <Apply> element constrains the relationship between two ***constrained attributes***, then the policy-user SHALL test whether the constraint is satisfied by the ***attributes***. If it is, then it SHALL proceed. If it is not, then the enclosing <Rule> element SHALL be eliminated.
4. If the <Apply> element constrains the relationship between two ***unconstrained attributes***, then the policy-user SHALL assign a value to one or both of the ***attributes*** that satisfies the constraint. If the required value is not in the available range, then the enclosing <Rule> element SHALL be eliminated.
5. If the <Apply> element constrains the relationship between a ***constrained attribute*** and an ***unconstrained attribute***, then the policy-user SHALL assign a value to the ***unconstrained attribute*** that satisfies the constraint. If the required value is not in the available range, then the enclosing <Rule> element SHALL be eliminated.
6. If the <Apply> element constrains ***authorized attributes***, then the policy-user SHALL obtain the required ***attribute*** from an acceptable authority. The ***strategy*** containing the ***attribute*** constraint should also indicate what constitutes an acceptable authority. If the required ***attribute*** cannot be obtained, then the enclosing <Rule> element SHALL be eliminated.

<Rule> elements MUST be examined in order until one survives the elimination procedure. This represents the highest preference **strategy** with which the policy-user is able to comply. Therefore, this (and only this) one SHALL be retained.

If, after completing the elimination step, no <Rule> elements remain, then the procedure SHALL terminate in failure.

6.7 Substitute <Apply> elements

Following elimination, a substitution step MAY be applied to the <Apply> elements of the remaining <Rule> element. Substitution proceeds by the following steps. ***Predicates*** that only express constraints between ***constrained attributes*** MAY be eliminated, as it has been determined by the previous step that these evaluate “True”. The substitutions shown in Table 2 SHALL be applied.

<Apply> element	Replacement <Apply> element
type-greater-than(a,b)	type-equal(a, ⌈ b)
type-greater-than-or-equal(a,b)	type-equal(a,b)
type-less-than(a,b)	type-equal(a, ⌊ b)
type-less-than-or-equal(a,b)	type-equal(a,b)
type-subset(a,b)	set-equals(a,b)

476 **Table 2 – Substitution procedure**

477 Where ⌈ represents the ceiling operation defined for the **attribute** and ⌊ represents the floor
478 operation.

479 In the case of a ***strategy*** that contains compatible, but non-combinable, ***predicates*** (see note to
480 Table 1) the `<Rule>` element will contain more than one `<Apply>` element constraining the
481 same **attribute**. In such cases, all but one of these `<Apply>` elements MUST be eliminated.
482 The choice of element to retain is left to the implementer. However, it is RECOMMENDED to
483 retain the final one, as this gives priority to the **combiner's** preference.

484 In the case that one `<Apply>` element expresses a relational constraint between two **attributes**,
485 and another `<Apply>` element expresses a literal constraint on one of those **attributes**, then the
486 value of this **attribute**, as dictated by the literal constraint, MAY be substituted for its designator
487 in the other `<Apply>` element. This procedure MAY be applied recursively until as many of the
488 relational constraints as possible have been replaced by literal constraints.

489 ### 6.8 Result

490 The result of this procedure is a set of **strategies**, one for each **aspect** of policy, and each
491 containing value assignments for **attributes** that are under the control of the policy-user. A
492 service invocation using these **attribute** assignments conforms with the applicable policy of both
493 the consumer and the provider.

---

494 # 7. Security considerations (Non-normative)

495 Policies must be integrity protected. The policy-user must confirm that the author of the policy is
496 an entity that is authoritative for the target end-point. How this is achieved is outside the scope of
497 this specification.

8. Bindings

<PolicySet> elements MAY be distributed in a **[WSDL 1.1]** or WSDL 1.2 service description or in a **[SOAP 1.1]** message. When they are distributed by one of these means, they MUST be distributed as defined in this section.

8.1 WSDL 1.1 (Normative)

This section defines how <PolicySet> elements SHALL be included in a WSDL 1.1 service description for a Web-service end-point.

8.1.1. Introduction

As a precursor to invoking a WSDL 1.1 operation of a WSDL 1.1 port, certain consumer configuration steps are likely to be required, and these configuration steps are likely to be associated with the port, rather than with an individual operation. Locating, retrieving, validating and combining policy are appropriate functions to perform as one of these configuration steps.

Different **aspects** of policy may be most applicable to different objects within the WSDL 1.1 data model, see Figure 1. For instance, privacy policy may apply to a WSDL 1.1 message definition, regardless of which WSDL 1.1 operation uses the message. Crypto-security policy, on the other hand, may apply to a message definition, differently, according to which operation uses the message. And, trust policy may apply to the port, independent of which operation or message is used.

8.1.2. Attachment

For the reasons stated in Section 8.1.1, a top-level <PolicySet> element SHALL be targeted only at a WSDL 1.1 port. However, it MUST be possible to associate a policy statement with any object (port, operation or message) either alone or in combination, see Figure 2. For this reason, policy statements MUST be capable of differentiating between the various WSDL 1.1 operation and message definitions of the WSDL 1.1 port at which they are targeted.

The WSDL 1.1 schema requires that <wsdl/port>, <wsdl/operation> and <wsdl/message> elements have a name attribute of type NCName. This attribute is used to associate policies with a particular port, operation or message or combinations thereof. URLs are a form of NCName.

8.1.3. Structure

Conformant <PolicySet> elements SHALL be structured as follows:

The top-level element SHALL be a <PolicySet> element whose <PolicySet/Target/Resources> element identifies the WSDL 1.1 port to which it is applicable, by means of the wsdl/port@name attribute.

Policies that apply to the WSDL 1.1 port, regardless of the particular operation or message SHALL be contained in <Policy> elements immediately subordinate to the top-level <PolicySet> element.

Policies that apply to some combination of WSDL 1.1 port, operation and message SHALL be contained in <PolicySet> elements subordinate to the top-level <PolicySet> element.

These second-level <PolicySet> elements SHALL have <PolicySet/Target/Actions> elements that identify the WSDL 1.1 operation, and <PolicySet/Target/Resources> elements that identify the WSDL 1.1 message to which they are applicable, by means of the wsdl/operation@name and wsdl/message@name attributes, respectively. Only WSDL 1.1 message definitions of the “input” type SHALL be identified.

The <Policy/Target/Resources> element SHALL identify the **aspect** of policy to which it applies.

8.1.4. Integrity/authenticity protection

If the <wsdl/definitions> element is integrity-protected, then the <PolicySet> elements SHOULD be included within the integrity-protection of that element.

Where it is not possible to do this, either because the <wsdl/definitions> element is not integrity-protected, or for other reasons, <PolicySet> elements SHALL be enclosed in a <saml/Assertion> element wrapper **[SAML]**. This allows supporting information, such as the saml/Assertion@Issuer attribute to be attached. The <saml/Assertion> element SHALL be integrity-protected.

The policy-user SHALL ignore the PolicySet@PolicySetId attribute.

The WSDL 1.1 port to which a policy applies SHALL be identified in the top-level <PolicySet/Target/Resources> element, by means of the wsdl/port@name attribute. The policy-user SHALL confirm that it has located the correct policy by examining the policy’s top-level <PolicySet/Target/Resources> element Furthermore, if they are present, the policy-user SHALL confirm that the policy is current, by examining the saml/Assertion/Conditions@NotBefore and saml/Assertion/Conditions@NotOnOrAfter attributes.

The wsdl/port@name attribute SHALL contain a URL. In the case where a policy is wrapped in a <saml/Assertion>, the host and domain parts of the wsdl/port@name URL SHALL be identical to the saml/Assertion@Issuer attribute value. The saml/Assertion@Issuer attribute value SHALL be identical to the CN attribute value in the subject field of the certificate **[X509]** that validates the <saml/Assertion> element, whether integrity protection is provided by SSL or XML Digital Signature.

8.1.5. Schema

A <PolicySet> element SHALL be included in a <wsdl/definitions> element in accordance with the following schema. Additions to the WSDL 1.1 SOAP binding are highlighted.

```
<?xml version="1.0" encoding="UTF-8"?>
<schema targetNamespace="http://schemas.xmlsoap.org/wsdl/policy-
conformant-soap/" xmlns="http://www.w3.org/2001/XMLSchema"

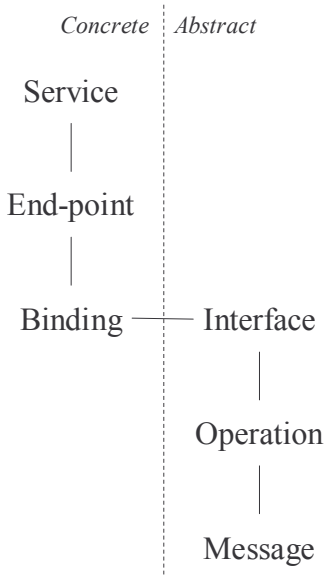
    <attribute name="binding" type="QName" use="required"/>
   </extension>
  </complexContent>
 </complexType>
</schema>
```

8.2 WSDL 1.2 draft (Non-normative)

Version 1.2 of WSDL is currently in draft form. Therefore, this specification does not provide a normative binding for XACML to WSDL 1.2. However, in the current draft of WSDL 1.2, the counterpart of the WSDL 1.1 port component is the WSDL 1.2 binding component (see Figure 3). Therefore, it is anticipated that, with the exception of swapping the roles of port and binding, the standard method of attaching a `<PolicySet>` to a WSDL 1.2 definition will be identical to the standard method of attaching a `<PolicySet>` to a WSDL 1.1 definition (see Section 8.1).



671

672 **Figure 3 - WSDL 1.2 draft data model**

673 ## 8.3 SOAP 1.1 (Normative)

674 ### 8.3.1. Introduction

675 In the case of a WSDL request-response-operation, consumer policies for the response message
676 MAY be conveyed in a SOAP header of the corresponding request message. The names
677 assigned to objects by the consumer are not guaranteed to match those assigned by the provider
678 to the equivalent objects. Therefore, the consumer MUST use the names assigned by the
679 provider to associate consumer policy with WSDL objects. This means that response policies
680 MUST be tailored to the particular provider, and the consumer may require a different policy for
681 each provider of the same service.

682 In the case of the WSDL solicit-response-operation and the notification-operation, the WSDL
683 technique, described above, SHALL be used to disseminate consumer policy.

684 ### 8.3.2. Structure

685 Conformant `<PolicySet>` elements SHALL be structured as described in Section 8.1.3, above.
686 Only WSDL message definitions of the “output” or “fault” types SHALL be targeted by policies.

687 ### 8.3.3. Integrity/authenticity protection

688 If the `<soap/header>` element is integrity-protected, then the `<PolicySet>` elements
689 SHOULD be included within the integrity-protection of that element.

690 Where it is not possible to do this, either because the `<soap/header>` element is not integrity-
691 protected, or for other reasons, `<PolicySet>` elements SHALL be enclosed in a
692 `<saml/Assertion>` element wrapper **[SAML]**. The `<saml/Assertion>` element SHALL be
693 integrity protected.

The policy-user SHALL ignore the `PolicySet@PolicySetId` attribute.

The policy-user SHALL verify that the `<PolicySet/Target>` element identifies the `wsdl/port@name` attribute of the WSDL 1.1 port that originated the request.

In the case where a policy is wrapped in a `<saml/Assertion>`, the host and domain parts of the authenticated name of the originating end-point SHALL be identical to the `saml/Assertion@Issuer` attribute value. The `saml/Assertion@Issuer` attribute value SHALL be identical to the CN attribute value in the subject field of the certificate **[X509]** that validates the `<saml/Assertion>` element, whether integrity protection is provided by SSL or XML Digital Signature.

If they are present, the policy-user SHALL confirm that the policy is current, by examining the `saml/Assertion/Conditions@NotBefore` and `saml/Assertion/Conditions@NotOnOrAfter` attributes.

8.3.4. Schema

An XACML `<PolicySet>` element SHALL be included in a SOAP header in accordance with the following schema.

```
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema
targetNamespace="urn:oasis:names:tc:xacml:wspl:draft:02"
xmlns:EndPointPolicy="urn:oasis:names:tc:xacml:wspl:draft:02"
xmlns:xs=http://www.w3.org/2001/XMLSchema
xmlns:xacml="urn:oasis:names:tc:xacml:1.0:policy"
xmlns:SOAP-ENV=http://schemas.xmlsoap.org/soap/envelope/
elementFormDefault="qualified" attributeFormDefault="unqualified">
  <xs:import namespace=http://schemas.xmlsoap.org/soap/envelope/
schemaLocation="http://schemas.xmlsoap.org/soap/envelope/"/>
  <xs:import namespace="urn:oasis:names:tc:xacml:1.0:policy"
schemaLocation="http://www.oasis-
open.org/committees/download.php/915/cs-xacml-schema-policy-
01.xsd"/>
  <xs:element name="Policy" type="EndPointPolicy:PolicyType"/>
  <xs:complexType name="PolicyType">
    <xs:complexContent>
      <xs:extension base="SOAP-ENV:Header">
        <xs:sequence>
          <xs:element ref="xacml:PolicySet"/>
        </xs:sequence>
      </xs:extension>
    </xs:complexContent>
  </xs:complexType>
</xs:schema>
```

Appendix A. Worked example (Non-normative)

A.1. Introduction

This appendix contains a worked example to illustrate the procedure for combining and reducing XACML policies that conform with this profile, using two simple policy instances. The example is drawn from the realm of data-rate allocation, and uses the service provider policy from Section 3.

A.2. Consumer policy

This section describes the service consumer's policy for the data-rate allocation **aspect** of service invocation.

The plain language description of the policy is as follows.

> The service-consumer's preference is to pay a maximum of ¢100/minute for a minimum guaranteed data-rate of 64kb/s.
>
> The second choice is to pay a maximum of ¢50/minute for a minimum guaranteed data-rate between 9pm and midnight of 32kb/s.

Expressed in XACML, the consumer policy becomes:

```
[b01]  <PolicySet PolicySetId="Q8MDqA1UdEEVsAQA" PolicyCombiningAlgId="deny-
       overrides">
[b02]    <Target>
[b03]      <Resources>

[b65] </PolicySet>
```

771 The first preference is expressed in lines [b26] – [b41]. The second choice is expressed in lines
772 [b42] – [b63].

773 # A.3. Combining procedure

774 ## A.3.1. Combine <PolicySet> elements

775 The `<Target>` elements of the two `<PolicySet>` elements are identical; [a02] – [a14] == [b02]
776 – [b14]. Therefore, they may be combined by appending the provider `<Policy>` elements to the
777 consumer `<Policy>` elements; [c15] - [c64] <- [b15] - [b64] and [c65] - [c114] <- [a15] - [a64],
778 and then assigning a new `PolicySetId` value; as in line [c01].

779

```
[c01]  <PolicySet PolicySetId="1UdAQEVsQ8MDAqAE" PolicyCombiningAlgId="deny-
       overrides">

[d103]    </PolicySet>
```

A.3.3. Combine <Rule> elements

`<Rule>` elements are combined by forming four new `<Rule>` elements from every possible pairing of one `<Rule>` element from the consumer's policy with one `<Rule>` element from the provider's policy. Each new `<Rule>` element is formed by appending the provider's `<Apply>` elements to the consumer's `<Apply>` elements and assigning a new `RuleId` value, as in lines [e26], [e54], [e88] and [e122]. For instance, lines [e26] - [e53] are formed from lines [d26] - [d41] and lines [d64] - [d79].

[e163]    </PolicySet>
```

A.3.4. Combine <Apply> elements and eliminate <Rule> elements

`<Apply>` elements are combined if they are combinable according to Table 1. Only the final `<Rule>` element, lines [e122] – [e161], contains combinable `<Apply>` elements. Therefore, the other `<Rule>` elements are eliminated.

For example, the first `<Rule>` element, lines [e26] – [e53], is not combinable because the “fee” attribute cannot be both less than or equal to 100, lines [e28] – [e33], **and** equal to 150, lines [e40] – [e45].

Similar considerations lead to the elimination of the second and third `<Rule>` elements.

The fourth `<Rule>` element, lines [e122] – [e161], is combinable because:

- the “fee” attribute **can** be both less than or equal to 50, lines [e124] – [e129], **and** equal to 45, lines [e142] – [e147], according to row 5 of Table 1;

- the “data-rate” attribute **can** be both greater than or equal to 32,000, lines [e130] – [e135], **and** equal to 40,000, lines [e148] – [e153], according to row 3 of Table 1; and
- the “time” attribute **can** be both greater than or equal to 21:00, lines [e136] – [e141], **and** greater than or equal to 18:00, lines [e154] – [e159], and max(21:00, 18:00) <- 21:00, according to row 9 of Table 1.

[f45]        </Rule>
[f46]      </Policy>
[f47]    </PolicySet>
```

A.3.5. Substitute <Apply> elements

Substitution involves replacing the “greater-than-or-equal” `functioneId` value at line [f38] with the “equal” value, making all the `<Apply>` elements into assignment statements.

```

[g46]           </Condition>
[g47]         </Rule>
[g48]       </Policy>
[g49]     </PolicySet>
```

816 The resulting `<PolicySet>` element represents a solution to both the consumer and provider
817 policy statements that gives priority to the preferences of the policy combiner – the consumer in
818 this instance. A service invocation using this solution conforms with both policies and should be
819 successful.

Appendix B. Revision history

Rev	Date	By whom	What
Draft 02	23 July 2003	Tim Moses	Limited functions and data-types to those defined by XACML. Prohibited the nesting of `<Apply>` elements. In the WSDL binding, targeted top-level policy statements at `<wsdl:port>` elements. Introduced two levels of `<PolicySet>` elements to allow finer targeting of policy statements. Added a “Security Considerations” section. Introduced the elimination step.
Draft 03	5 Sep 2003	Tim Moses	Added text clarifying **attribute** classification. Modified approach to combining involving greater-than and less-than operations to eliminate floor and ceiling functions. Clarified the procedure when compatible, but non-combinable, **predicates** are present. Added text in WSDL 1.2 binding section.
Draft 04	29 Sep 2003	Tim Moses	Clarified the procedure when one of the `<PolicySet>` elements to be combined contains a second-level `<PolicySet>` element and the other one does not. Included a description of the example.
