26

Abstract:

27

This document defines a subset of OASIS WSS: SOAP Message Security. This subset is intended to minimize the resource requirements of its implementation and maximize the performance, while keeping the interoperability with the base specification.

## 66 Introduction

67 The OASIS Web Services Security : SOAP Message Security specification defines a very flexible  
68 way to secure SOAP messages and exchange security information using SOAP messages.

69 When WSS: SOAP Message Security is implemented on resource-limited platforms such as  
70 PDA's, it is desirable that constraints be imposed on the use of the core specification to ensure  
71 that the messages received by resource-limited platforms can be efficiently processed by them. A  
72 naïve implementation of WSS: SOAP Message Security can be very inefficient. The overhead of  
73 creating and verifying XML Signature with its associated "NodeSet" semantics could be a major  
74 source of this inefficiency. For example, if within the signature, signed data is referenced using  
75 an Xpath expression or and XSLT transform, then it will be very hard to verify the signature  
76 without first generating a NodeSet structure, which can be very costly. In many such cases, it is  
77 necessary to explicitly create a NodeSet data structure in memory and manipulate it according to  
78 the specified transforms. Canonicalization can be another source of inefficiency because of  
79 character encoding conversion and repeated serialization and deserialization required in the  
80 specification.

81 The goal of this document is to define a subset of WSS: SOAP Message Security that (1) allows  
82 stream processing on the receiving side of signed and encrypted messages, (2) requires no  
83 explicit canonicalization on the receiving side, and (3) requires no signature transforms requiring  
84 NodeSet evaluation. The subset, called MProf, is 100% compatible the WSS: SOAP Message  
85 Security specification. All the messages in this profile are valid WSS: SOAP Message Security  
86 messages.

87 This specification is intended to be applicable to both SOAP 1.1 and SOAP 1.2.

---

## 88 1 Notations and Terminology

89 This section specifies the notations, namespaces, and terminology used in this  
90 specification.

### 91 1.1 Notational Conventions

92 The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",  
93 "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this  
94 document are to be interpreted as described in RFC 2119.

95 When describing abstract data models, this specification uses the notational  
96 convention used by the XML Infoset. Specifically, abstract property names always  
97 appear in square brackets (e.g., [some property]).

98 When describing concrete XML schemas, this specification uses the notational convention of  
99 WSS: Minimalist Profile (MProf). Specifically, each member of an element's [children] or  
100 [attributes] property is described using an XPath-like notation (e.g.,  
101 /x:MyHeader/x:SomeProperty/@value1). The use of {any} indicates the presence of an element  
102 wildcard (<xs:any/>). The use of @{any} indicates the presence of an attribute wildcard  
103 (<xs:anyAttribute/>)

104 This specification is designed to work with the general SOAP message structure and message  
105 processing model, and should be applicable to any version of SOAP. The current SOAP 1.2  
106 namespace URI is used herein to provide detailed examples, but there is no intention to limit the  
107 applicability of this specification to a single version of SOAP.

108 Readers are presumed to be familiar with the terms in the [Internet Security Glossary](#)

## 109 1.2 Namespaces

110 The following namespaces are used in this document:

Prefix	Namespace
ds	<a href="http://www.w3.org/2000/09/xmlsig#">http://www.w3.org/2000/09/xmlsig#</a>
S	<a href="http://www.w3.org/2001/12/soap-envelope">http://www.w3.org/2001/12/soap-envelope</a>
xenc	<a href="http://www.w3.org/2001/04/xmlenc#">http://www.w3.org/2001/04/xmlenc#</a>
wsse	<a href="http://schemas.xmlsoap.org/ws/2002/xx/secext">http://schemas.xmlsoap.org/ws/2002/xx/secext</a>
wsu	<a href="http://schemas.xmlsoap.org/ws/2002/xx/utility">http://schemas.xmlsoap.org/ws/2002/xx/utility</a>

## 111 1.3 Schema and WSDL Files

112 The schema for this specification can be located at:

113 <http://schemas.xmlsoap.org/ws/2003/02/mprof>

## 114 1.4 Terminology

115 We introduce the following terms that are used throughout this document:

116 **MProf** – Shorthand notation of this specification, Minimalist Profile of Web Services  
117 Security : SOAP Message Security

118 **Exc-C14N** – Shorthand notation of Exclusive Canonicalization

119 **NodeSet** – XPath NodeSet as defined in XPath

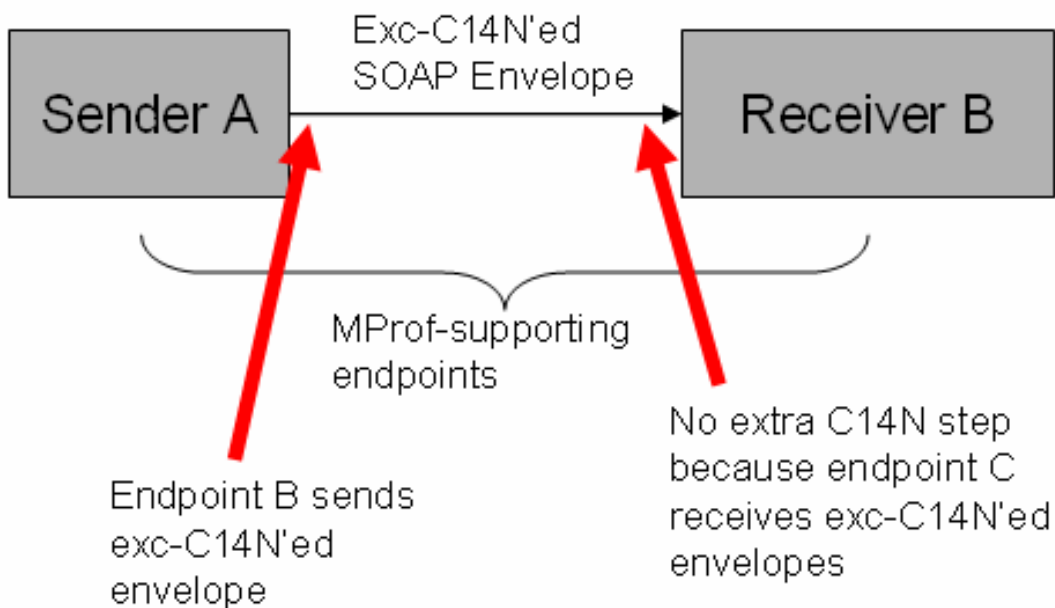

120 **MProf transform** – A transform algorithm that complies with this specification

121 **Stable Exc-C14N element** – An element in an exc-C14N'ed document that satisfies  
122 certain conditions (see Section 2.1.2).

---

## 123 2 MProf Messaging Model

124 In order to eliminate the necessity of performing canonicalization on the receiving  
125 side while preserving interoperability with other applications, the sender **MUST**  
126 prepare an already canonicalized message and intermediaries should preserve the  
127 canonicalization. We define a security header extension and processing rules that  
128 allow the receiver to know that the sender and intermediaries support MProf. This  
129 allows the receiver to expect all the incoming messages from this sender and  
130 intermediaries to be MProf messages.

131 When the sender and intermediaries “observe” MProf, the receiver can anticipate the  
 132 received messages to have the following properties:

- 133 1. They are already canonicalized using Exclusive Canonicalization (we call it  
 134 exc-C14N hereafter) and all the signed parts can be processed without  
 135 computing exc-C14N explicitly. (Only exclusive canonicalization without  
 136 comments may be used.)
- 137 2. There are no transforms that require explicit NodeSet computation.
- 138 3. The receiver knows elements to be signed in advance, so the receiver can  
 139 start calculating the hash of the signed elements as soon as it encounters the  
 140 start tag of the element. Therefore, the receiver can process these messages  
 141 without expensive operations.

142 Another possible scenario is that even if the sender is a non-MProf endpoint, an  
 143 intermediary may be able to convert ordinary WSS: SOAP Message Security  
 144 messages into MProf messages if they satisfy certain properties described in this  
 145 document.

## 146 2.1 MProf awareness

147 This document defines a new `wsse:MProf` header. This header is specified whenever a sender  
 148 of a message asserts that the message is conformant with the profile and that the conformance  
 149 MUST be maintained to the specified actor/role. For example, if the actor/role is 'next' then that  
 150 actor/role MAY alter the message so as not to be conformant. If, however, there is a header  
 151 targeted at the ultimate receiver then the message MUST maintain conformance until delivery at  
 152 the ultimate receiver. The sender that is following this profile is REQUIRED to include the  
 153 `wsse:MProf` header element on all messages. The `mustUnderstand` attribute MUST be set to the

154 value of "1" in `wsse:MProf` headers to ensure that recipients know that this is an MProf  
155 message and how to process it.

156 When an intermediary is the target of a MProf message it is required to process the  
157 message. If the intermediary does not support the MProf header the node MUST  
158 return a SOAP Fault to the sender and stop processing the received message.

159 Each MProf header MAY be signed, using the mechanisms defined in WS-Security to  
160 allow the recipient to verify that MProf processing is appropriate for the message as  
161 received from the previous party.

162 Any SOAP node that supports Web Services Security : SOAP Message Security should  
163 be able to receive MProf messages because MProf is a strict subset of Web Services  
164 Security : SOAP Message Security. However, some nodes may support MProf only.  
165 When such a SOAP node detects that a received message is a non-MProf compliant  
166 message, the node MUST return a SOAP Fault to the sender and stop processing the  
167 received message.

168 The following illustrates the syntax of this header:

```
169 <S:Envelope>  
170   <S:Header>  
171     <wsse:MProf Stable="..." S:mustUnderstand="1" >  
172       </wsse:MProf>  
173     ...  
174   </S:Header>  
175   ...  
176 </S:Envelope>
```

177 The following describes the attributes and elements listed in the example above:

178 **/wsse:MProf**

179 This header element defines the method of messaging used. Use of the  
180 header indicates sender adherence to the requirements of this profile for the  
181 SOAP message.

182 **/wsse:MProf/{any}**

183 This is an extensibility mechanism to allow additional information based on a  
184 schema to be passed in an MProf element.

185 **/wsse:Mprof/@Stable**

186 This required QName attribute indicates the type of "canonicalization stability"  
187 to which this message conforms. Two forms of stability are described in  
188 subsequent specifications.

189 **/wsse:Mprof/@S:mustUnderstand="1"**

190 This required attribute indicates that recipient MUST understand the  
191 semantics of this profile in order to process the message.

192 **/wsse:Mprof/@{any}**

193 This is an extensibility mechanism to allow additional information based on a  
194 schema to be added as a MProf header attributes.

195 **Note:** This specification requires requires use of "0" and "1" for MustUnderstand, which is  
196 consistent with the WS-I Basic Profile.

## 197 2.2 MProf Specification

198 MProf messages MUST satisfy each of the conditions described below in the  
199 subsections.

### 200 2.2.1 Conditions on the <ds:Reference> element

201 In order to avoid computational intensive NodeSet operations, MProf messages are  
202 not allowed to have generic transformations in their <ds:Signature> elements. They  
203 are allowed to have optional XML Decryption transforms provided by the sender to  
204 enable simplified receiver processing, when signatures and encryption are combined.  
205 In addition, each <Reference> element is required to have an explicit  
206 transformation algorithm as the last transform, which is either exc-C14N  
207 (<ds:Transform Algorithm="http://www.w3.org/2001/10/xml-exc-c14n#" />) or  
208 one of the MProf transforms defined later in this section. No other transforms are  
209 permitted.

210 Any <ds:Reference> element in an MProf message MUST have one of the following  
211 forms:

- 212 1. An intra-document URI, where the <ds:Reference> element has an URI="..."  
213 fragment attribute that has an intra-document URI value (i.e., in the form of  
214 "#id") whose referent appears after the enclosing <ds:Signature> element.  
215 Furthermore, the <ds:Reference> element has a <ds:Transforms> element,  
216 which has an optional decryption transform followed by <ds:Transform  
217 Algorithm="http://www.w3.org/2001/10/xml-exc-c14n#" />.
- 218 2. A 'same-document' reference, where the <ds:Reference> element has an empty  
219 URI attribute, that is, URI="". XPointer alternatives are not allowed. Furthermore,  
220 the <ds:Reference> element has a <ds:Transforms> element, which has an  
221 optional decryption transform followed by <ds:Transform  
222 Algorithm="tfmAlg" /> where tfmAlg is one of MProf transforms (described  
223 below).
- 224 3. An attachment URI, where the <ds:Reference> element has a cid: URI value in  
225 the case of multipart MIME. [SOAP].

226 In the same document reference (case 2), the transform algorithm MUST satisfy the  
227 following conditions:

- 228 - The input of the transform algorithm is the NodeSet of the entire SOAP envelope.
- 229 - The output of the transform algorithm is an octet string that is a subsequence of  
230 the exc-C14N form of the entire envelope. A subsequence of a string is a string  
231 obtained by removing one or more characters from the original string.

232 A transform algorithm satisfying these conditions is called *MProf transform*. For  
233 example, a transform that returns a concatenation of <wsu:Timestamp> header and  
234 the <S:Body> element in the exc-C14N'ed envelope is an MProf transform. The use of  
235 an MProf transform ensures that the receiving node can calculate the digest of the  
236 referent without applying any canonicalization. Appendix A of this specification  
237 defines a set well-known MProf transforms that SHOULD be supported by compliant  
238 implementations.

## 239 2.2.2 Restricted Stability form of XML Canonicalization

240 An MProf message MUST maintain exc-C14N state at the message's top level in order  
241 to avoid extraneous exclusive canonicalization operations. The message MUST also  
242 be idempotent with regard to exclusive canonicalization operations on signed parts.  
243 We define a restricted stable form of *exc-C14N* (*wsse:StableRestricted*) as an exc-  
244 C14N representation of an element that does not change when the entire document  
245 is exc-C14N'ed. This requires at least two things:

- 246 - The element's representation complies with exc-C14N (character encoding, white  
247 space normalization, etc).
- 248 - All the namespace prefixes explicitly used in the element MUST be declared  
249 within the element.
- 250 - If required by an XML processor, then if the same namespace URI is declared at  
251 an ancestor element, the namespace prefixes MAY be different.

252 A receiving SOAP endpoint does not need to compute exc-C14N on a signed element  
253 if it is a stable exc-C14N'ed element, because it is already exc-C14N'ed. A stable exc  
254 - C14N'ed element is a completely legal well-formed XML element so non-MProf-  
255 aware endpoint should have no problem processing it. In the following example  
256 where we assume that the whole envelope has been already exc-C14N'ed, elements  
257 <S:Envelope> and <tru:StockSymbol> are both stable exc-C14N'ed element  
258 because all the necessary namespace declarations are self-contained.

```
259 <S:Envelope xmlns:S="http://... ">  
260   ...  
261 <S:Body>  
262   <tru:StockSymbol xmlns:tru="http://fabrikam123.com/payloads">  
263     QQQ  
264   </tru:StockSymbol>  
265 </S:Body>  
266 </S:Envelope>
```

267 On the other hand, <S:Body> is not stable because the namespace prefix S is not  
268 declared within this element's scope. If this element is to be signed, it's exc-C14N  
269 form will have an xmlns:S="http://... " declaration in the <S:Body> tag. This is not  
270 desirable since it uses the same prefix as the S:Envelope declaration.

271 Therefore, all the signed parts of an MProf message MUST be stable exc-C14N  
272 elements. This requirement has consequences on three places in a Web Services  
273 Security : SOAP Message Security message.

- 274 - The <ds:SignedInfo> element MUST be a stable exc-C14N'ed element.
- 275 - The value of a <ds:CanonicalizationMethod> element in a <ds:Signature>  
276 element MUST always be <http://www.w3.org/2001/10/xml-exc-c14n#>

- 277 - Any element that is referred to by a <ds:Reference> element through an intra-  
278 document reference in the URI attribute MUST be a stable exc-C14N'ed element.  
279 Note that this condition allows a signature on an entire element (a node and all of  
280 its descendant nodes) only when wsu:id is used for referring to the signed  
281 portion. When signing a node and its proper subset of the descendant nodes and  
282 all of its associated attributes, an MProf transform needs to be used.

283 In order to provide a stable body element for signing, after exc-c14n the previous  
284 example would be recast as follows:

285

```
286 <S:Envelope xmlns:S="http://... ">  
287   ...  
288   <Sb:Body xmlns:Sb="...">  
289     <tru:StockSymbol xmlns:tru="http://fabrikam123.com/payloads">  
290       QQQ  
291     </tru:StockSymbol>  
292   </Sb:Body>  
293 </S:Envelope>
```

### 294 **2.2.3 Safe Stability form of XML Canonicalization**

295 An MProf message MUST maintain exc-C14N state at the message's top level in order  
296 to avoid extraneous exclusive canonicalization operations. The message MUST also  
297 be idempotent with regard to exclusive canonicalization operations on signed parts.  
298 We define a safe stable form of exc-C14N (wsse:StableSafe) as an exc-C14N  
299 representation of an element that does not change when the entire document is exc-  
300 C14N'ed. This requires at least two things:

- 301 - The element's representation complies with exc-C14N (character encoding, white  
302 space normalization, etc).  
303 - All the namespace prefixes explicitly used in the QName element and/or  
304 attributes values MUST be declared within the element.

305 A receiving SOAP endpoint does not need to compute exc-C14N on a signed element  
306 if it is a safe stable form of exc-C14N'ed element, because it is already exc-C14N'ed.  
307 A stable exc-C14N'ed element is a completely legal well-formed XML element so  
308 non-MProf-aware endpoint should have no problem processing it.

### 309 **2.2.4 Message Canonicalization Conditions**

310 The sender MUST canonicalize the SOAP message, including mustUnderstand, role  
311 and attribute formats and processing instruction and whitespace.

312 Specifically, the normative processing rules specified in SOAP Message  
313 Canonicalization must be implemented. That specification is incorporated by  
314 reference; the following extract is included here for convenience:

315 The following processing rules are required, as stated in SOAP Message  
316 Canonicalization:

- 317 • For child element information items of the SOAP Header element information  
318 item:
  - 319 ○ If the SOAP mustUnderstand attribute information item is present with  
320 a value of "0" or "false" then remove the mustUnderstand attribute  
321 information item.
  - 322 ○ If the SOAP role attribute information item is present with a value of  
323 "http://www.w3.org/2002/06/soap-envelope/role/ultimateReceiver"  
324 or "" then remove the role attribute information item.
  - 325 ○ If the SOAP relay attribute information item is present with a value of  
326 "0" or "false" then remove the relay attribute information item.
- 327 • Processing instruction information items that are children of the SOAP  
328 Envelope , Header , Fault , Code , Subcode , Value , Reason , Text , Node and  
329 Role element information items are removed.
- 330 • Whitespace character information items that are children of the SOAP  
331 Envelope , Header , Fault , Code , Subcode , Value , Reason , Node and Role  
332 element information items are removed.

333

334 The handling of the processing for "true" or "1" values is handled differently here  
335 than in the SOAP Messaging Canonicalization Note, in order to be consistent with the  
336 WS-I Basic Profile (R1013):

- 337 • For child element information items of the SOAP Header element information  
338 item:
  - 339 ○ If the SOAP mustUnderstand attribute information item is present with  
340 a value of "1" or "true" then change its value to "1".
- 341 • If the SOAP relay attribute information item is present with a value of "true"  
342 then change its value to "1".

## 343 **2.2.5 Security Token Order Conditions**

344 In MProf messages, if a security token is referenced in a signature or encryption  
345 element (<ds:Signature>, <xenc:EncryptedKey>, <xenc:ReferenceList>, or  
346 <xenc:EncryptedData>) and if the security token is carried in the same envelope,  
347 the security token MAY appear before it is referenced. In addition, this intra-envelope  
348 reference MUST be done through a wsu:Id attribute and <wsse:Reference  
349 URI="..."/> element. This condition allows implementations to have necessary key  
350 materials ready at the point they are needed. The receiving node MAY stop  
351 processing the message if the referenced token is not yet available when it is used  
352 (i.e., the token appears after it is used) and MAY return a SOAP Fault.

## 353 2.2.6 XML Digital Signature Constraints

354 The following constraints are applied to XML Digital Signatures when MProf messaging is used.  
355 Note that this only applies to signatures conveyed in the SOAP header. Note also that  
356 SignatureProperty elements *are* allowed.

## 357 2.2.7 KeyInfo Handling

358 KeyInfo as defined in the XML Signature recommendation offers a wide variety of  
359 extensible means for conveying key information, including the ability to specify a URI  
360 for retrieving key information, a variety of X.509 certificate representations, PGP,  
361 SPKI and other possibilities. In addition, WSS: SOAP Message Security defines a  
362 number of security tokens that may be referenced using a SecurityTokenReference.  
363 The WSS: SOAP Message Security specification recommends that WSS: SOAP  
364 Message Security tokens be used but allows other KeyInfo usages for signatures.  
365 The MProf REQUIRES use of Web Services Security : SOAP Message Security tokens  
366 and disallows arbitrary KeyInfo usages.

## 367 2.2.8 Algorithm Constraints

368 Use of the XML Signature HMAC algorithm is an option to consider both to reduce receiver  
369 processing requirements as well as to enable streaming data, but is not a requirement.

## 370 2.2.9 Manifests

371 XML Signature Manifests MUST NOT be used in MProf compliant signatures. Manifests are a  
372 mechanism to allow applications to avoid reference digest validation when it makes sense in the  
373 application context. In the SOAP messaging context this is not desired or required.

## 374 2.2.10 Processing Rules

375 The sender MUST perform XML and SOAP Message canonicalization before any  
376 signing operations are performed.

---

## 377 3 Example

378 The following example shows an MProf signed and encrypted message. Note that in  
379 order to improve readability, this example is not exactly exc-C14N'ed. In particular,  
380 white spaces within a tag and empty tags should be read as if they were exc -  
381 C14N'ed.

```
382 <S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/"  
383   S:encodingStyle="http://schemas.xmlsoap.org/soap/encoding/">  
384   <S:Header>  
385     <wsse:MProf Stable="wsse:StableRestricted" S:mustUnderstand="1" >  
386     </wsse:MProf>  
387     <wsse:Security
```

```

422 </wsse:Security>
423 </S:Header>
424 <S1:Body xmlns:wsu="http://schemas.xmlsoap.org/ws/2002/07/utility"
425     xmlns:S1="http://schemas.xmlsoap.org/soap/envelope/"
426     wsu:Id="i4">
427 <EncryptedData xmlns="http://www.w3.org/2001/04/xmlenc#"
428     Id="i1" Type="http://www.w3.org/2001/04/xmlenc#Content">
429 <EncryptionMethod
430     Algorithm="http://www.w3.org/2001/04/xmlenc#tripledes-cbc"/>
431 <CipherData><CipherValue>DXnqS...PyFHzo7Pw==</CipherValue></CipherData>
432 </EncryptedData>
433 </S1:Body>
434 </S:Envelope>
```

435 Note that the namespace prefix S1 is declared in the <S1:Body> element although  
436 the same namespace URI is already bound to another prefix, S. This is required for  
437 the <S1:Body> element to be a stable exc-C14N element.

---

## 438 4 Security Considerations

439 This specification introduces no additional security [considerations over and above the](#)  
440 [ones defined in WSS: SOAP Message Security](#) specification.

---

## 441 5 Acknowledgements

442 We would like to thank the following people for their contributions towards this  
443 specification:

444 Garry Ellison, Sun

445 Ron Monzillo, Sun

## Appendix C. Notices

494 OASIS takes no position regarding the validity or scope of any intellectual property or other rights  
495 that might be claimed to pertain to the implementation or use of the technology described in this  
496 document or the extent to which any license under such rights might or might not be available;  
497 neither does it represent that it has made any effort to identify any such rights. Information on  
498 OASIS's procedures with respect to rights in OASIS specifications can be found at the OASIS  
499 website. Copies of claims of rights made available for publication and any assurances of licenses  
500 to be made available, or the result of an attempt made to obtain a general license or permission  
501 for the use of such proprietary rights by implementors or users of this specification, can be  
502 obtained from the OASIS Executive Director.

503 OASIS invites any interested party to bring to its attention any copyrights, patents or patent  
504 applications, or other proprietary rights which may cover technology that may be required to  
505 implement this specification. Please address the information to the OASIS Executive Director.

506 Copyright © The Organization for the Advancement of Structured Information Standards [OASIS]  
507 2002. All Rights Reserved.

508 This document and translations of it may be copied and furnished to others, and derivative works  
509 that comment on or otherwise explain it or assist in its implementation may be prepared, copied,  
510 published and distributed, in whole or in part, without restriction of any kind, provided that the  
511 above copyright notice and this paragraph are included on all such copies and derivative works.  
512 However, this document itself does not be modified in any way, such as by removing the  
513 copyright notice or references to OASIS, except as needed for the purpose of developing OASIS  
514 specifications, in which case the procedures for copyrights defined in the OASIS Intellectual  
515 Property Rights document must be followed, or as required to translate it into languages other  
516 than English.

517 The limited permissions granted above are perpetual and will not be revoked by OASIS or its  
518 successors or assigns.
